Location-based Authentication/Authorization In Adversarial Environments

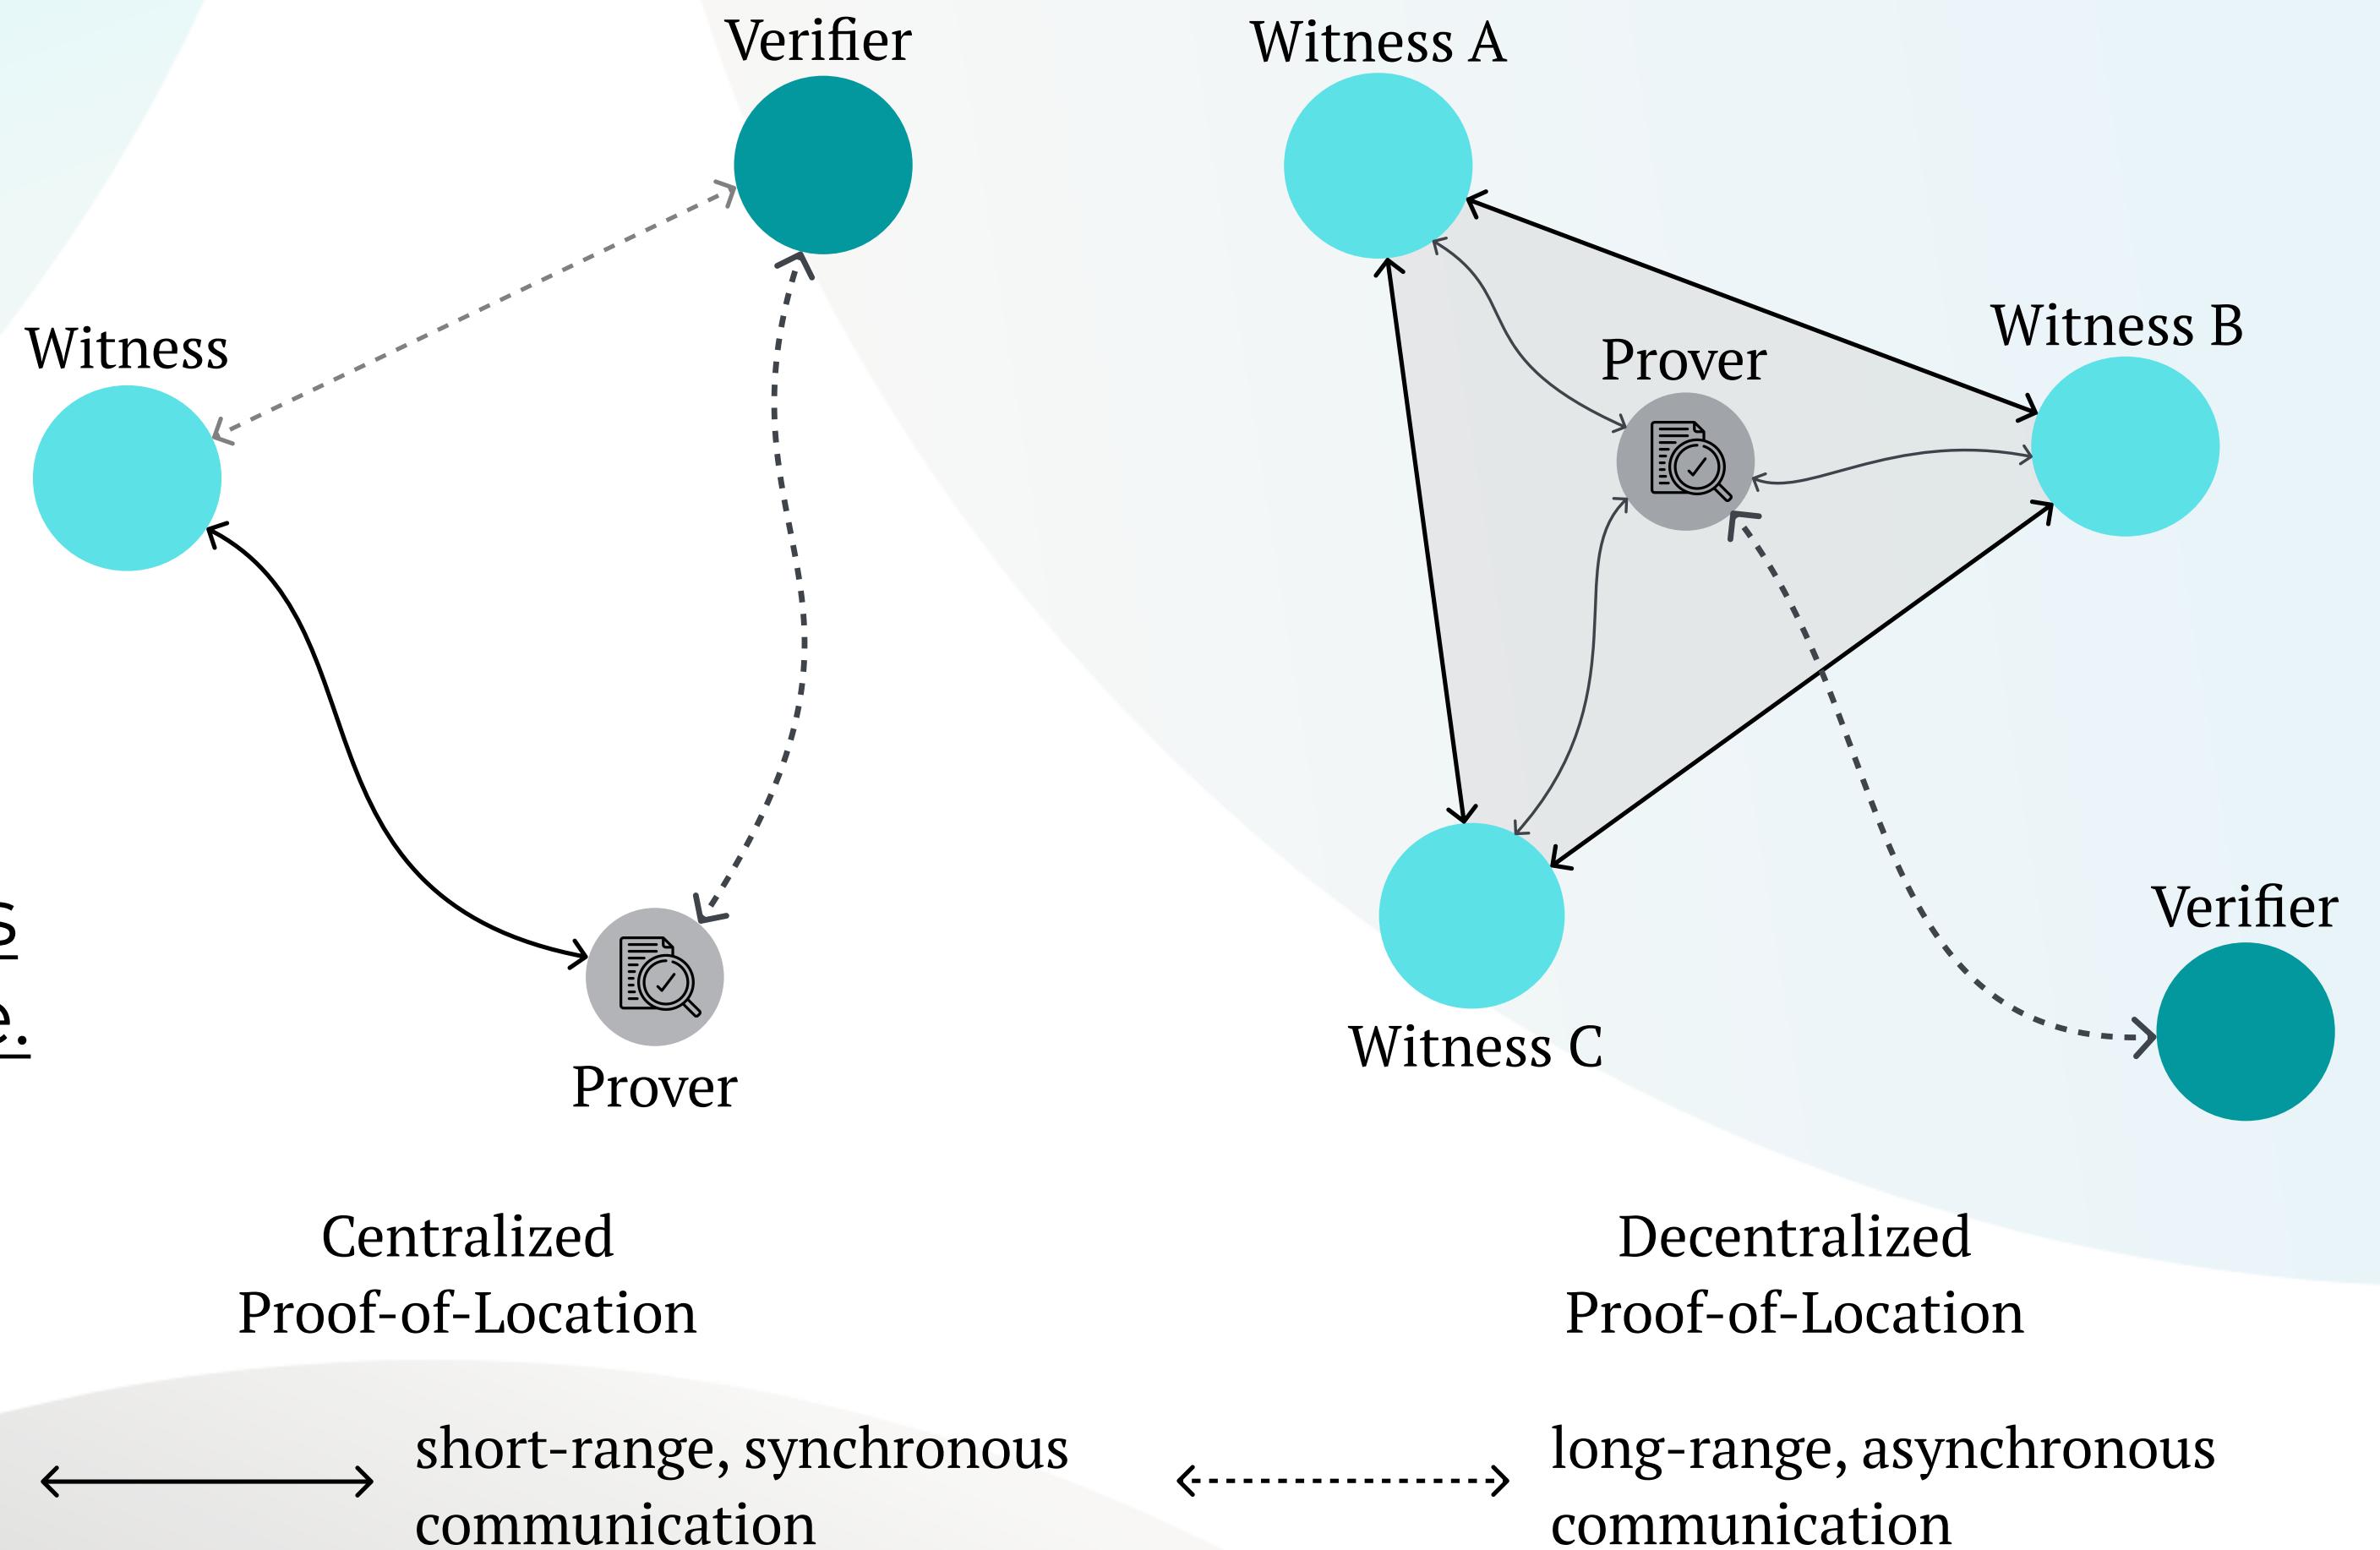

Thesis Outline

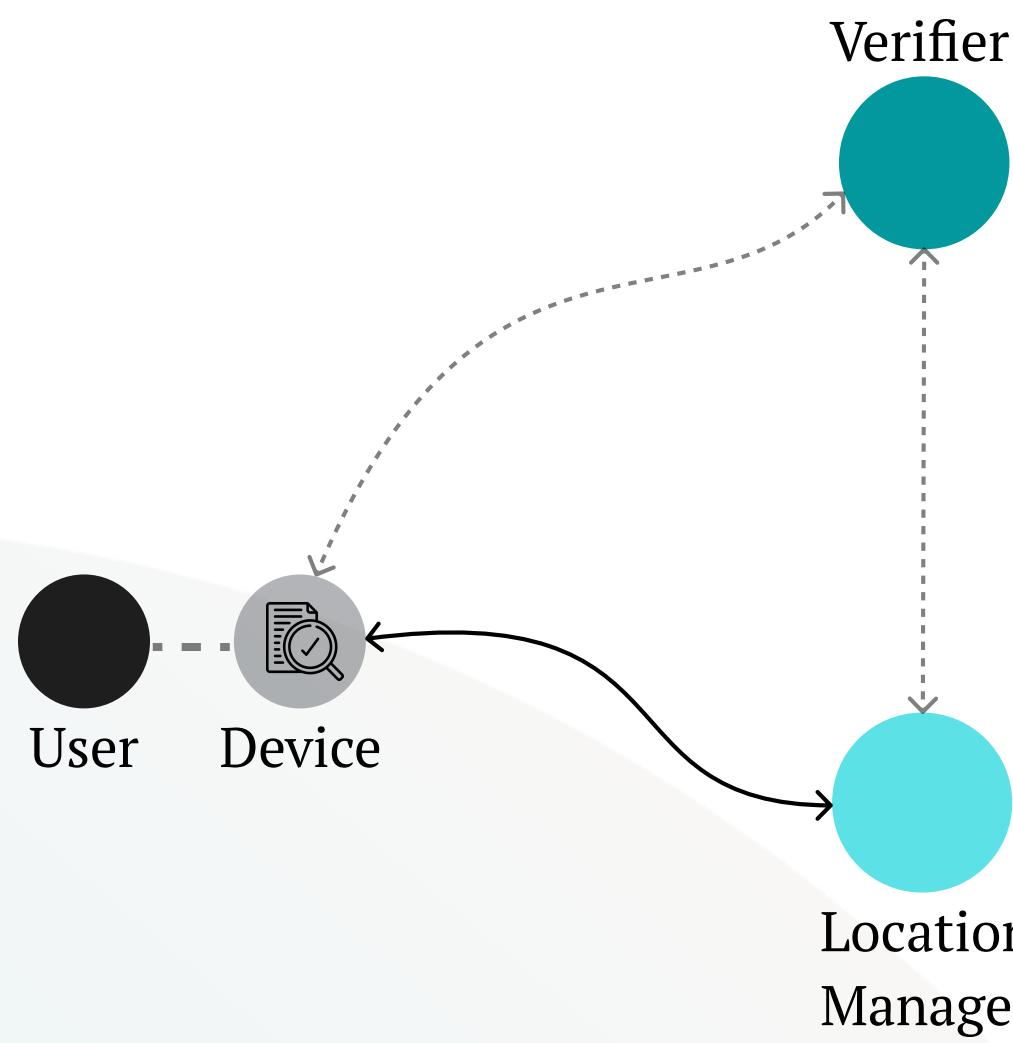

A digital Proof-of-Location

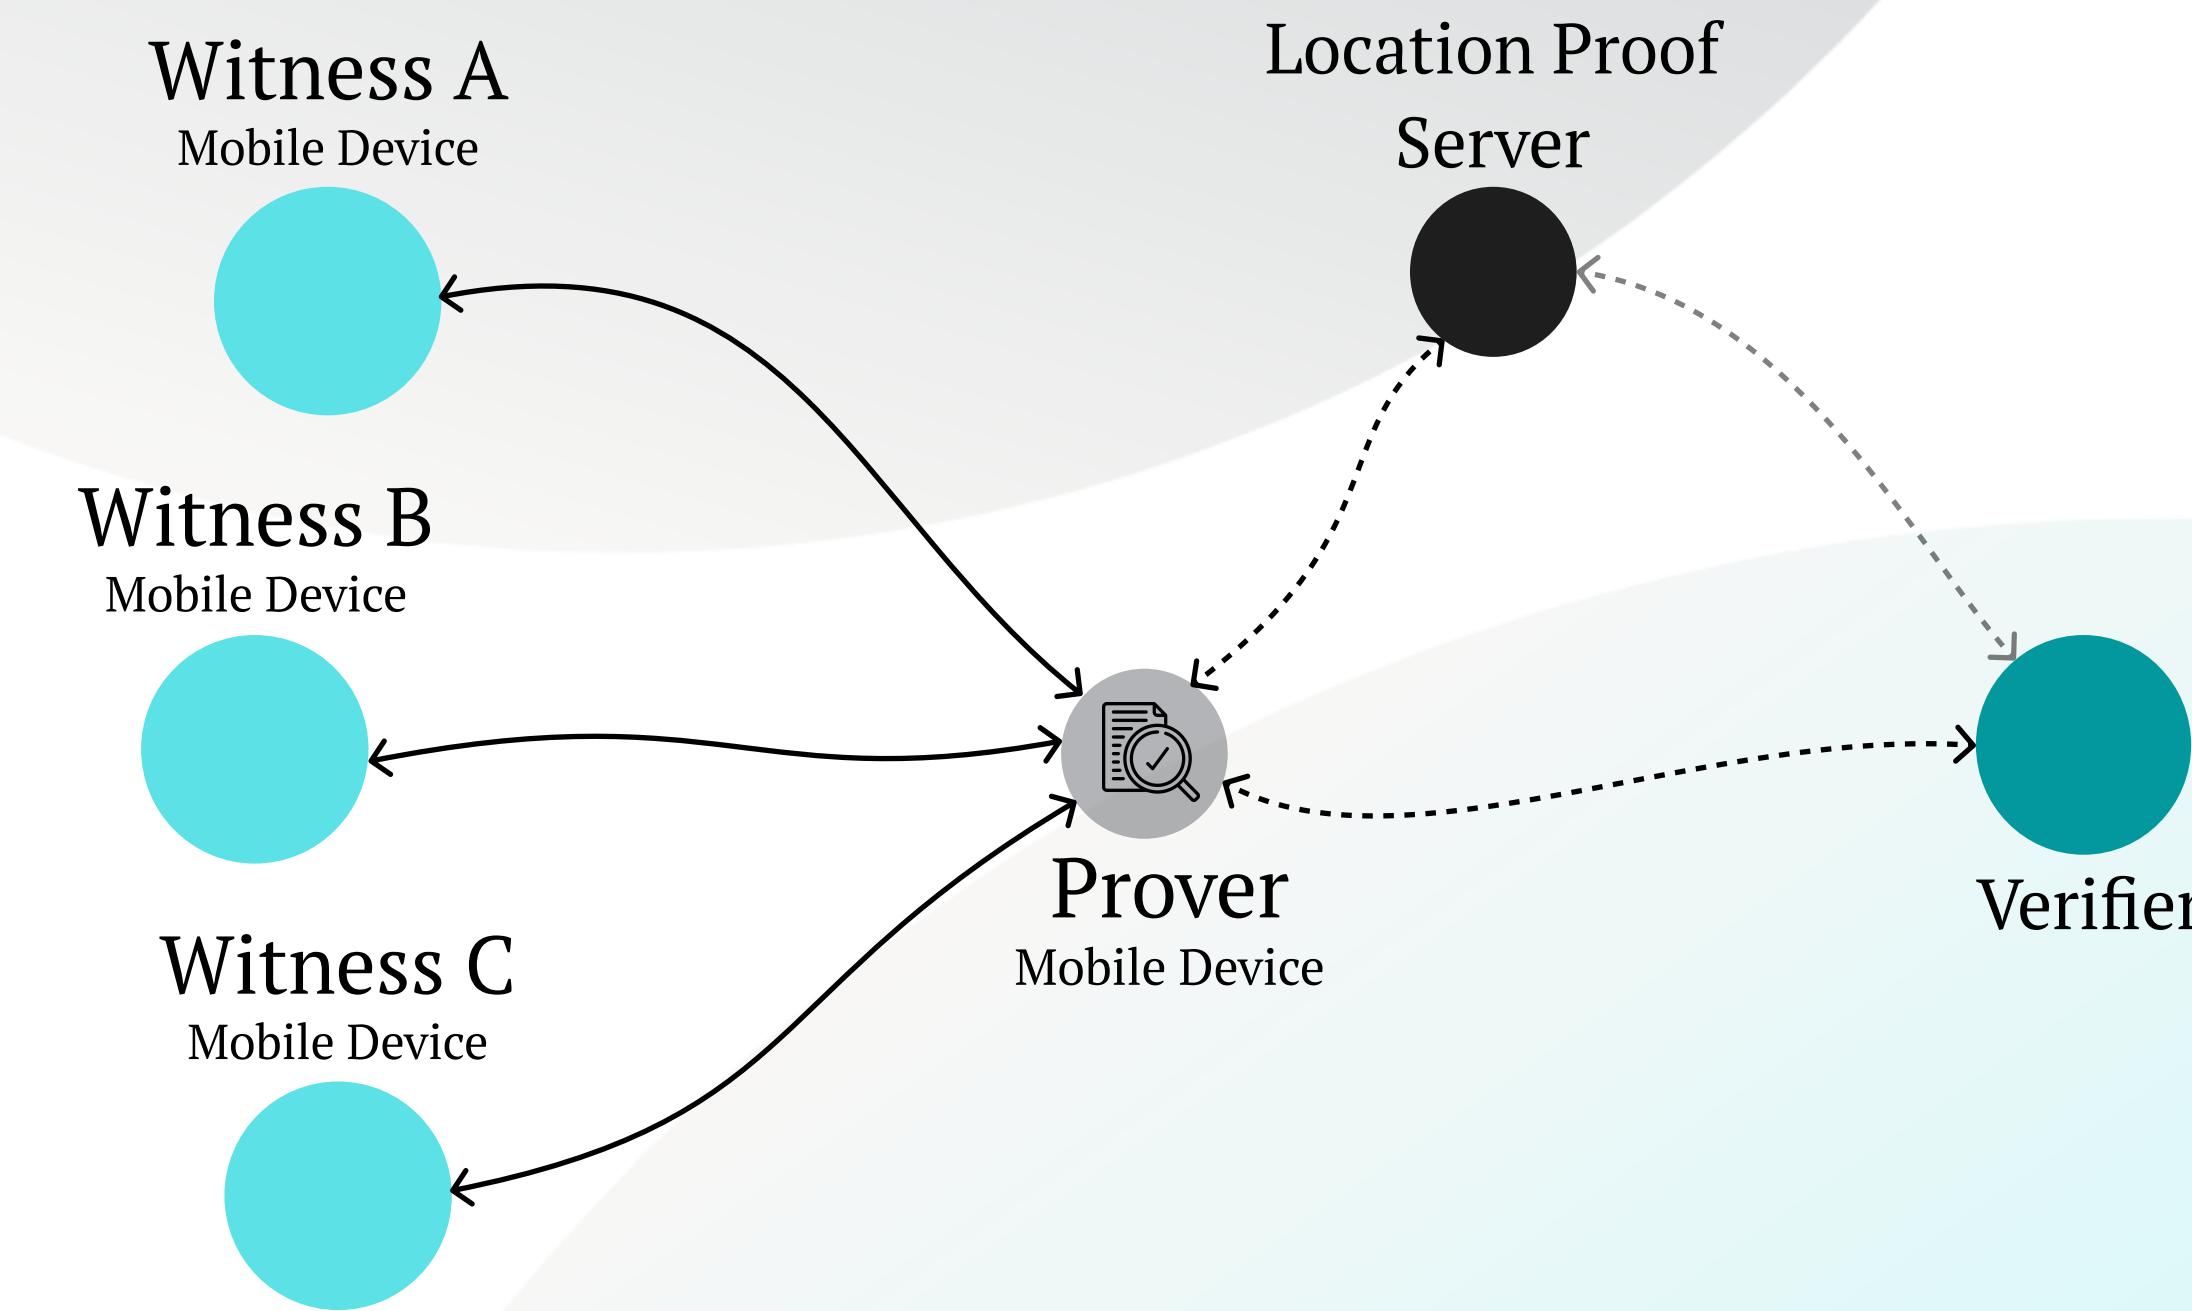

Is an electronic certificate that attests one's position in both space and time.

The evolution of Location Proof Systems

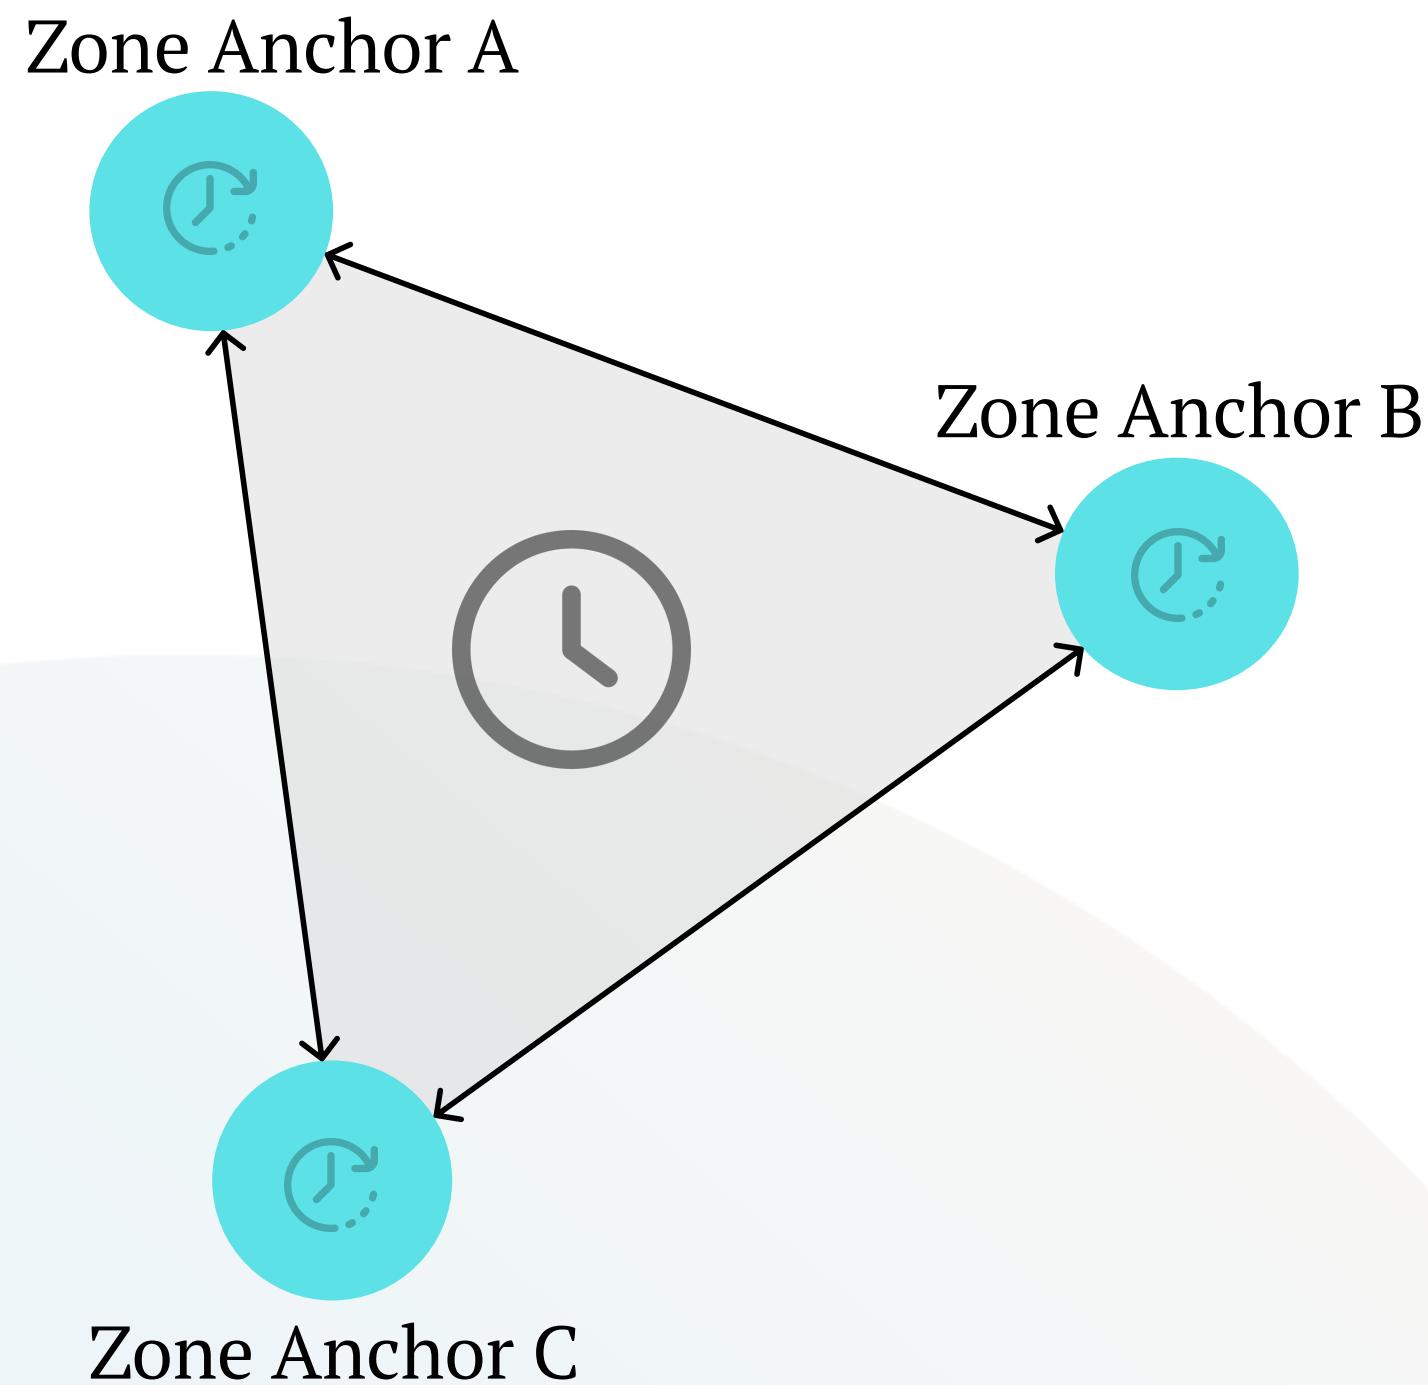

Trusted and Centralized
Architectures

Progressively Distributed
Systems

The evolution of Location Proof Systems

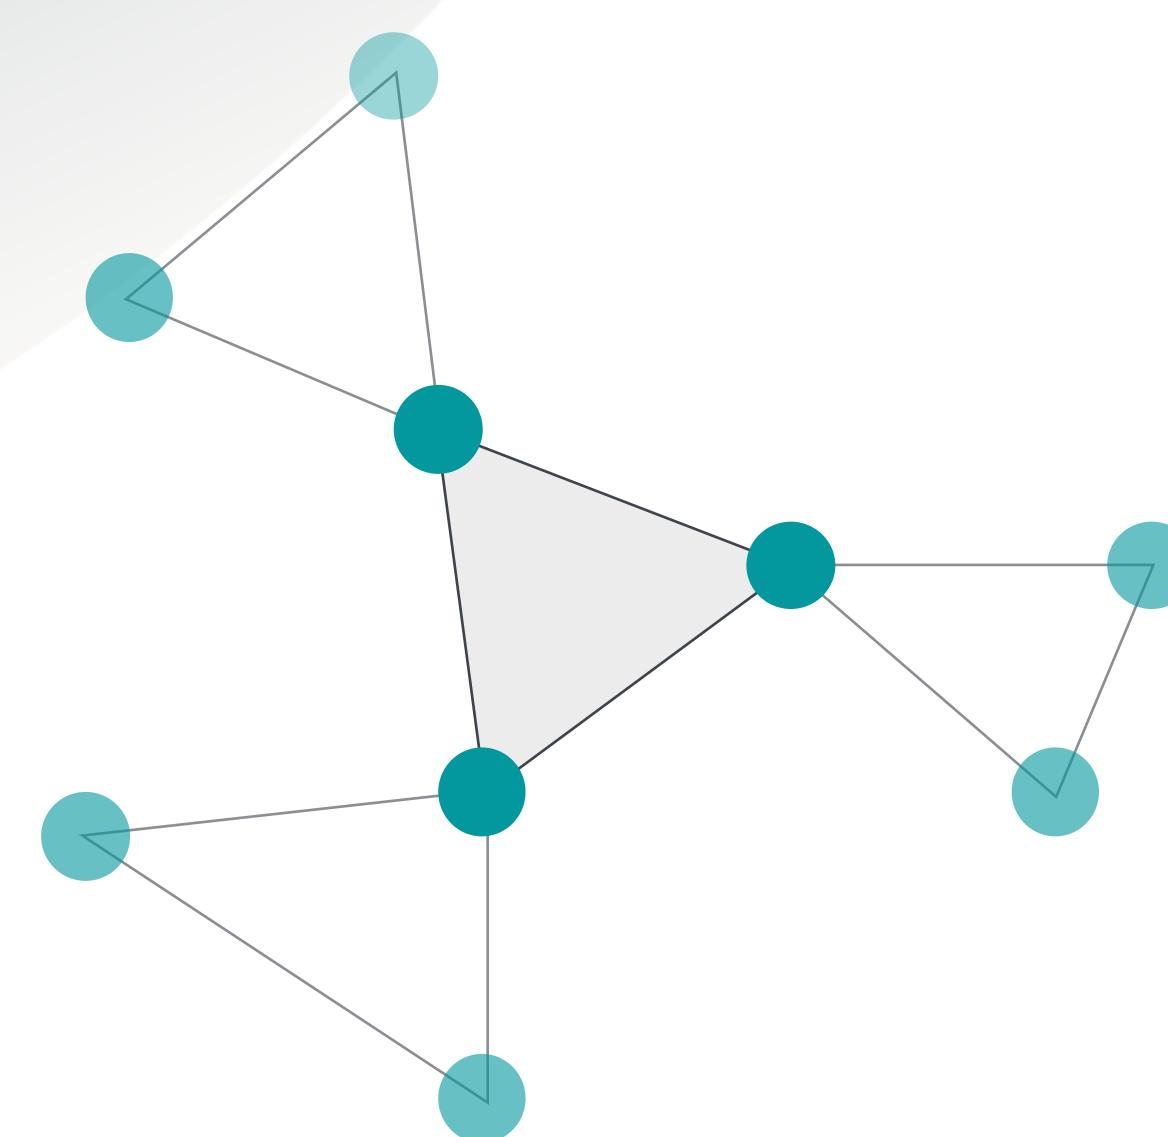

Considered secure if:

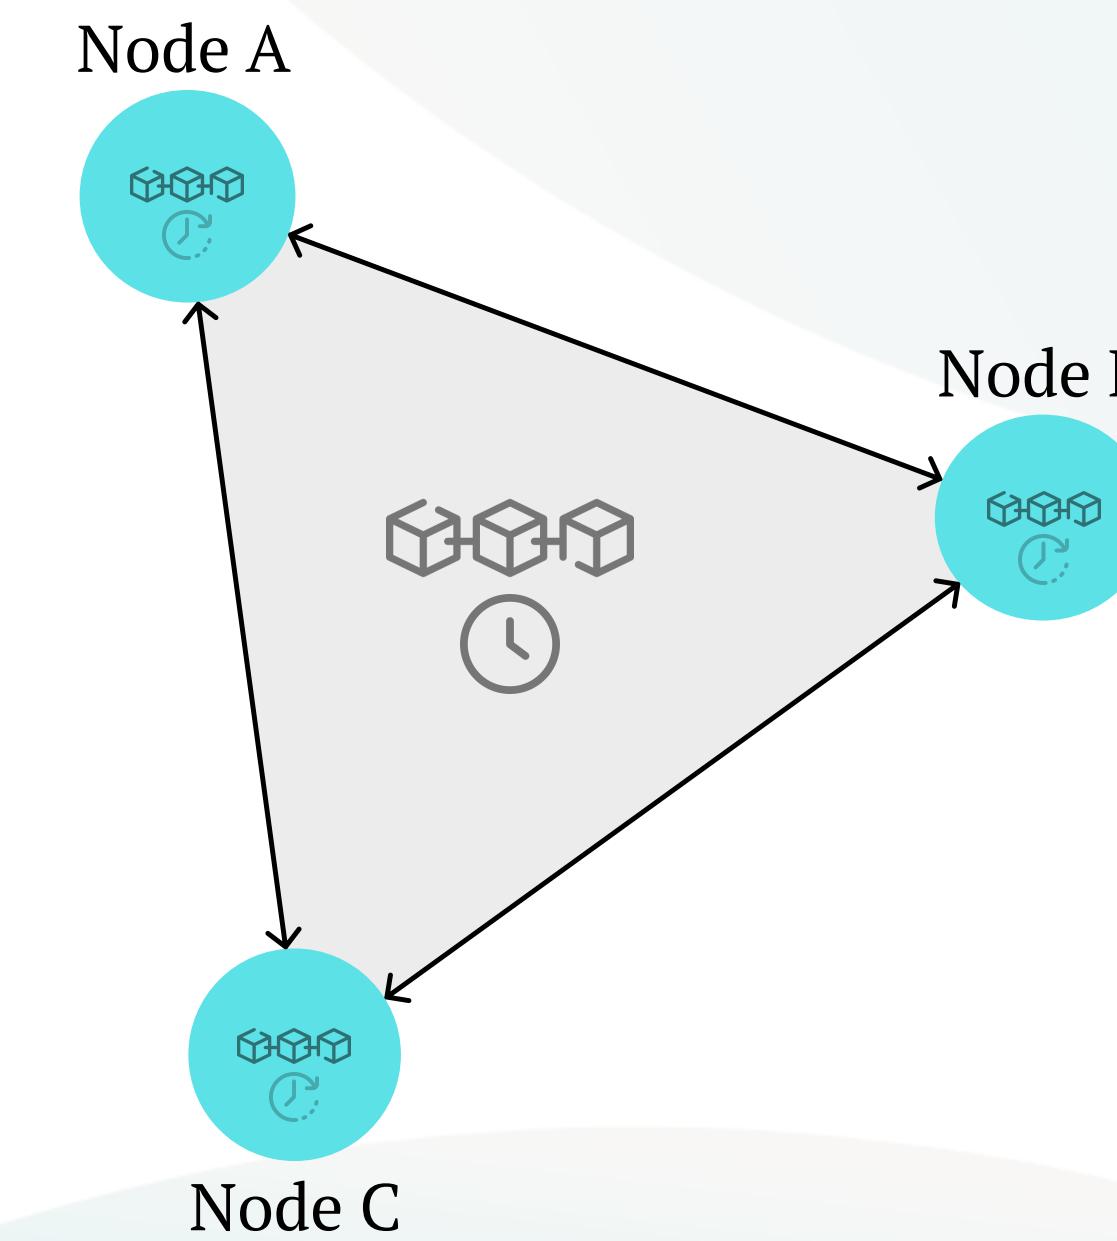

- Complete
- Spatio-temporally sound
- Non-transferable

Decentralized
Protocols

Space Synchronization + Time Synchronization

=

Decentralized Proof-of-Location

Dynamic and Non-Hierarchic Mesh Networks

Layer 2 Routing Protocols

Peer-to-Peer
Short-ranged Communication

Neighbourhood
Discovery and Ranking

Zone Establishment
and Affinity

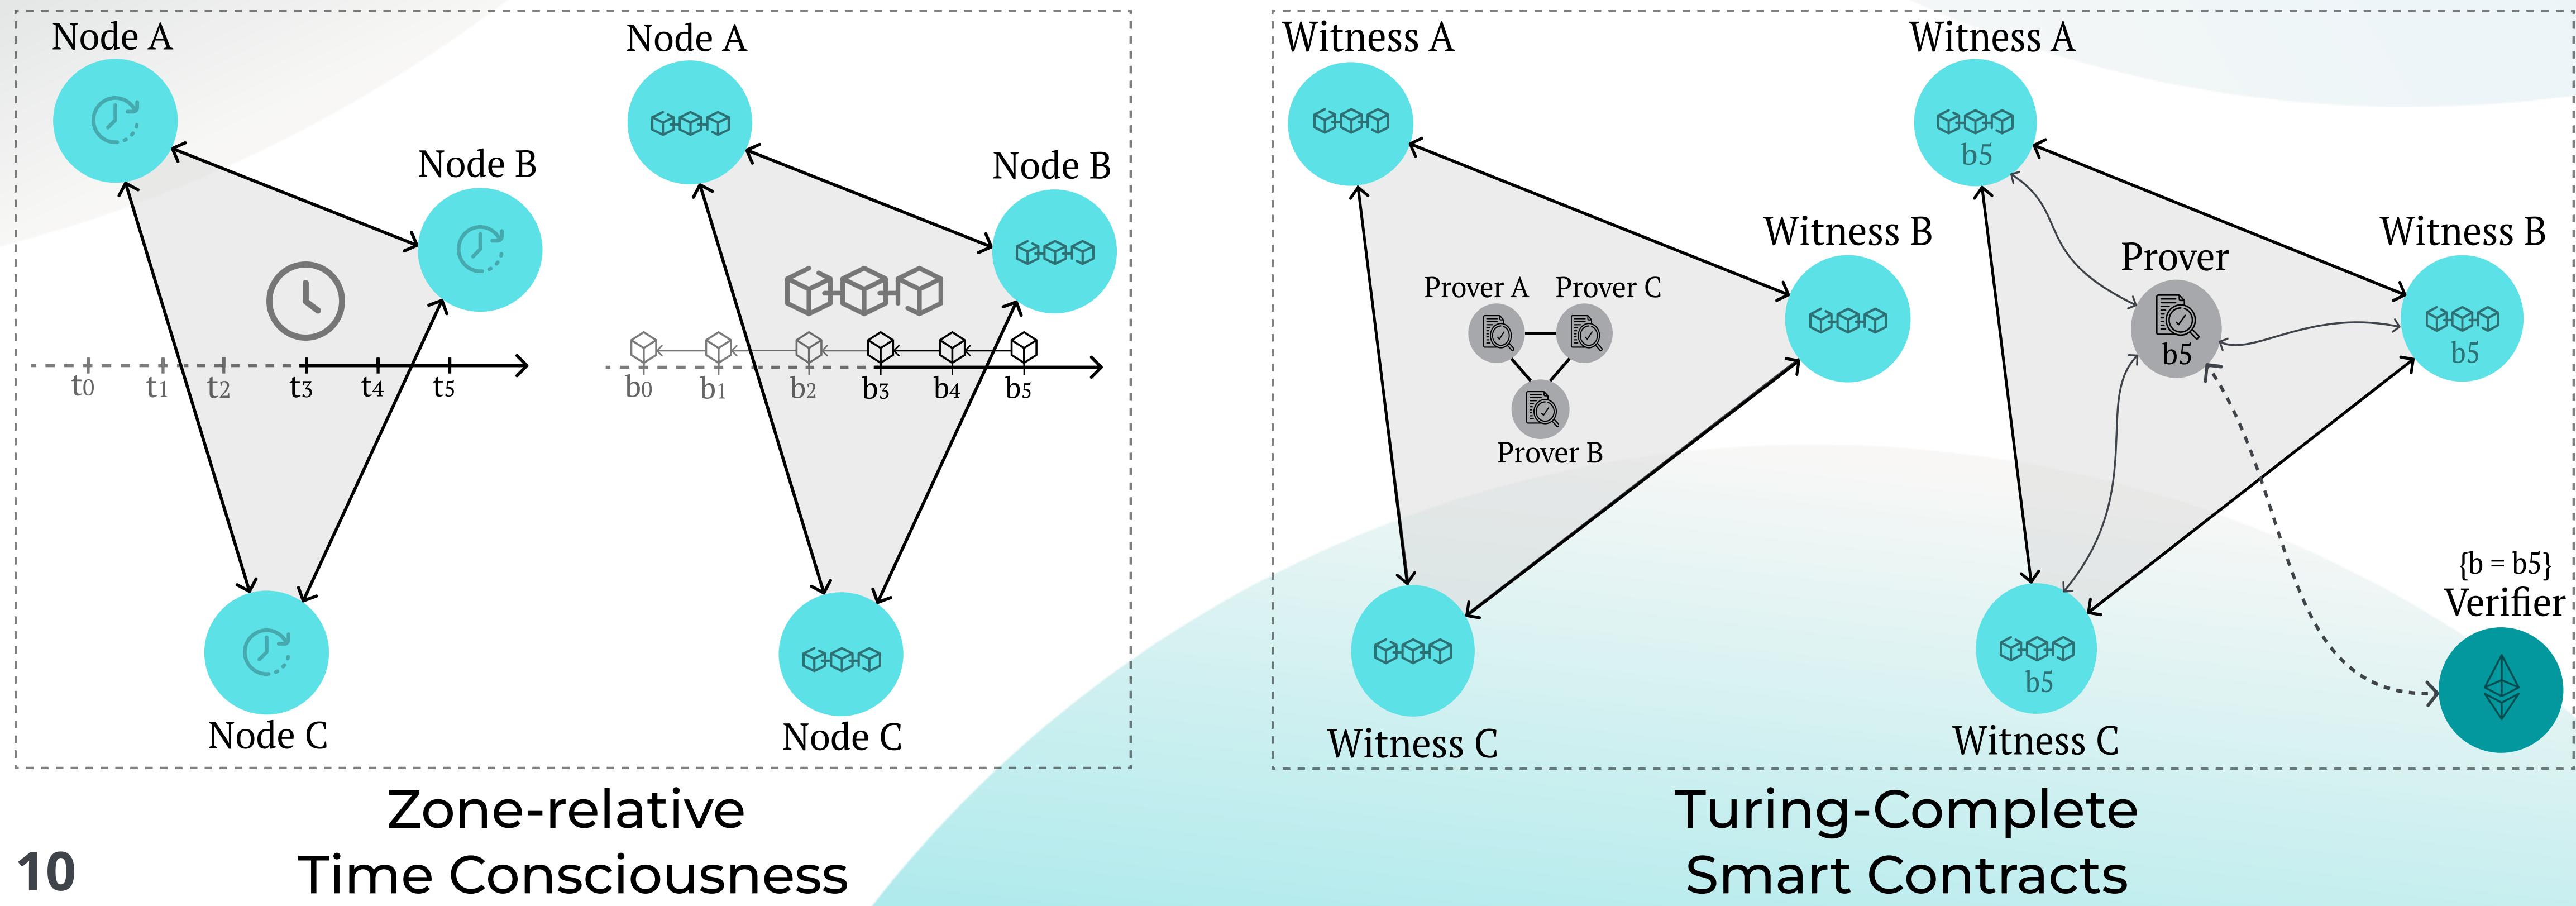

Testbed Setup and Network Architecture

OpenWrt, QEMU, batman-adv

Turing-Complete Clock Synchronization

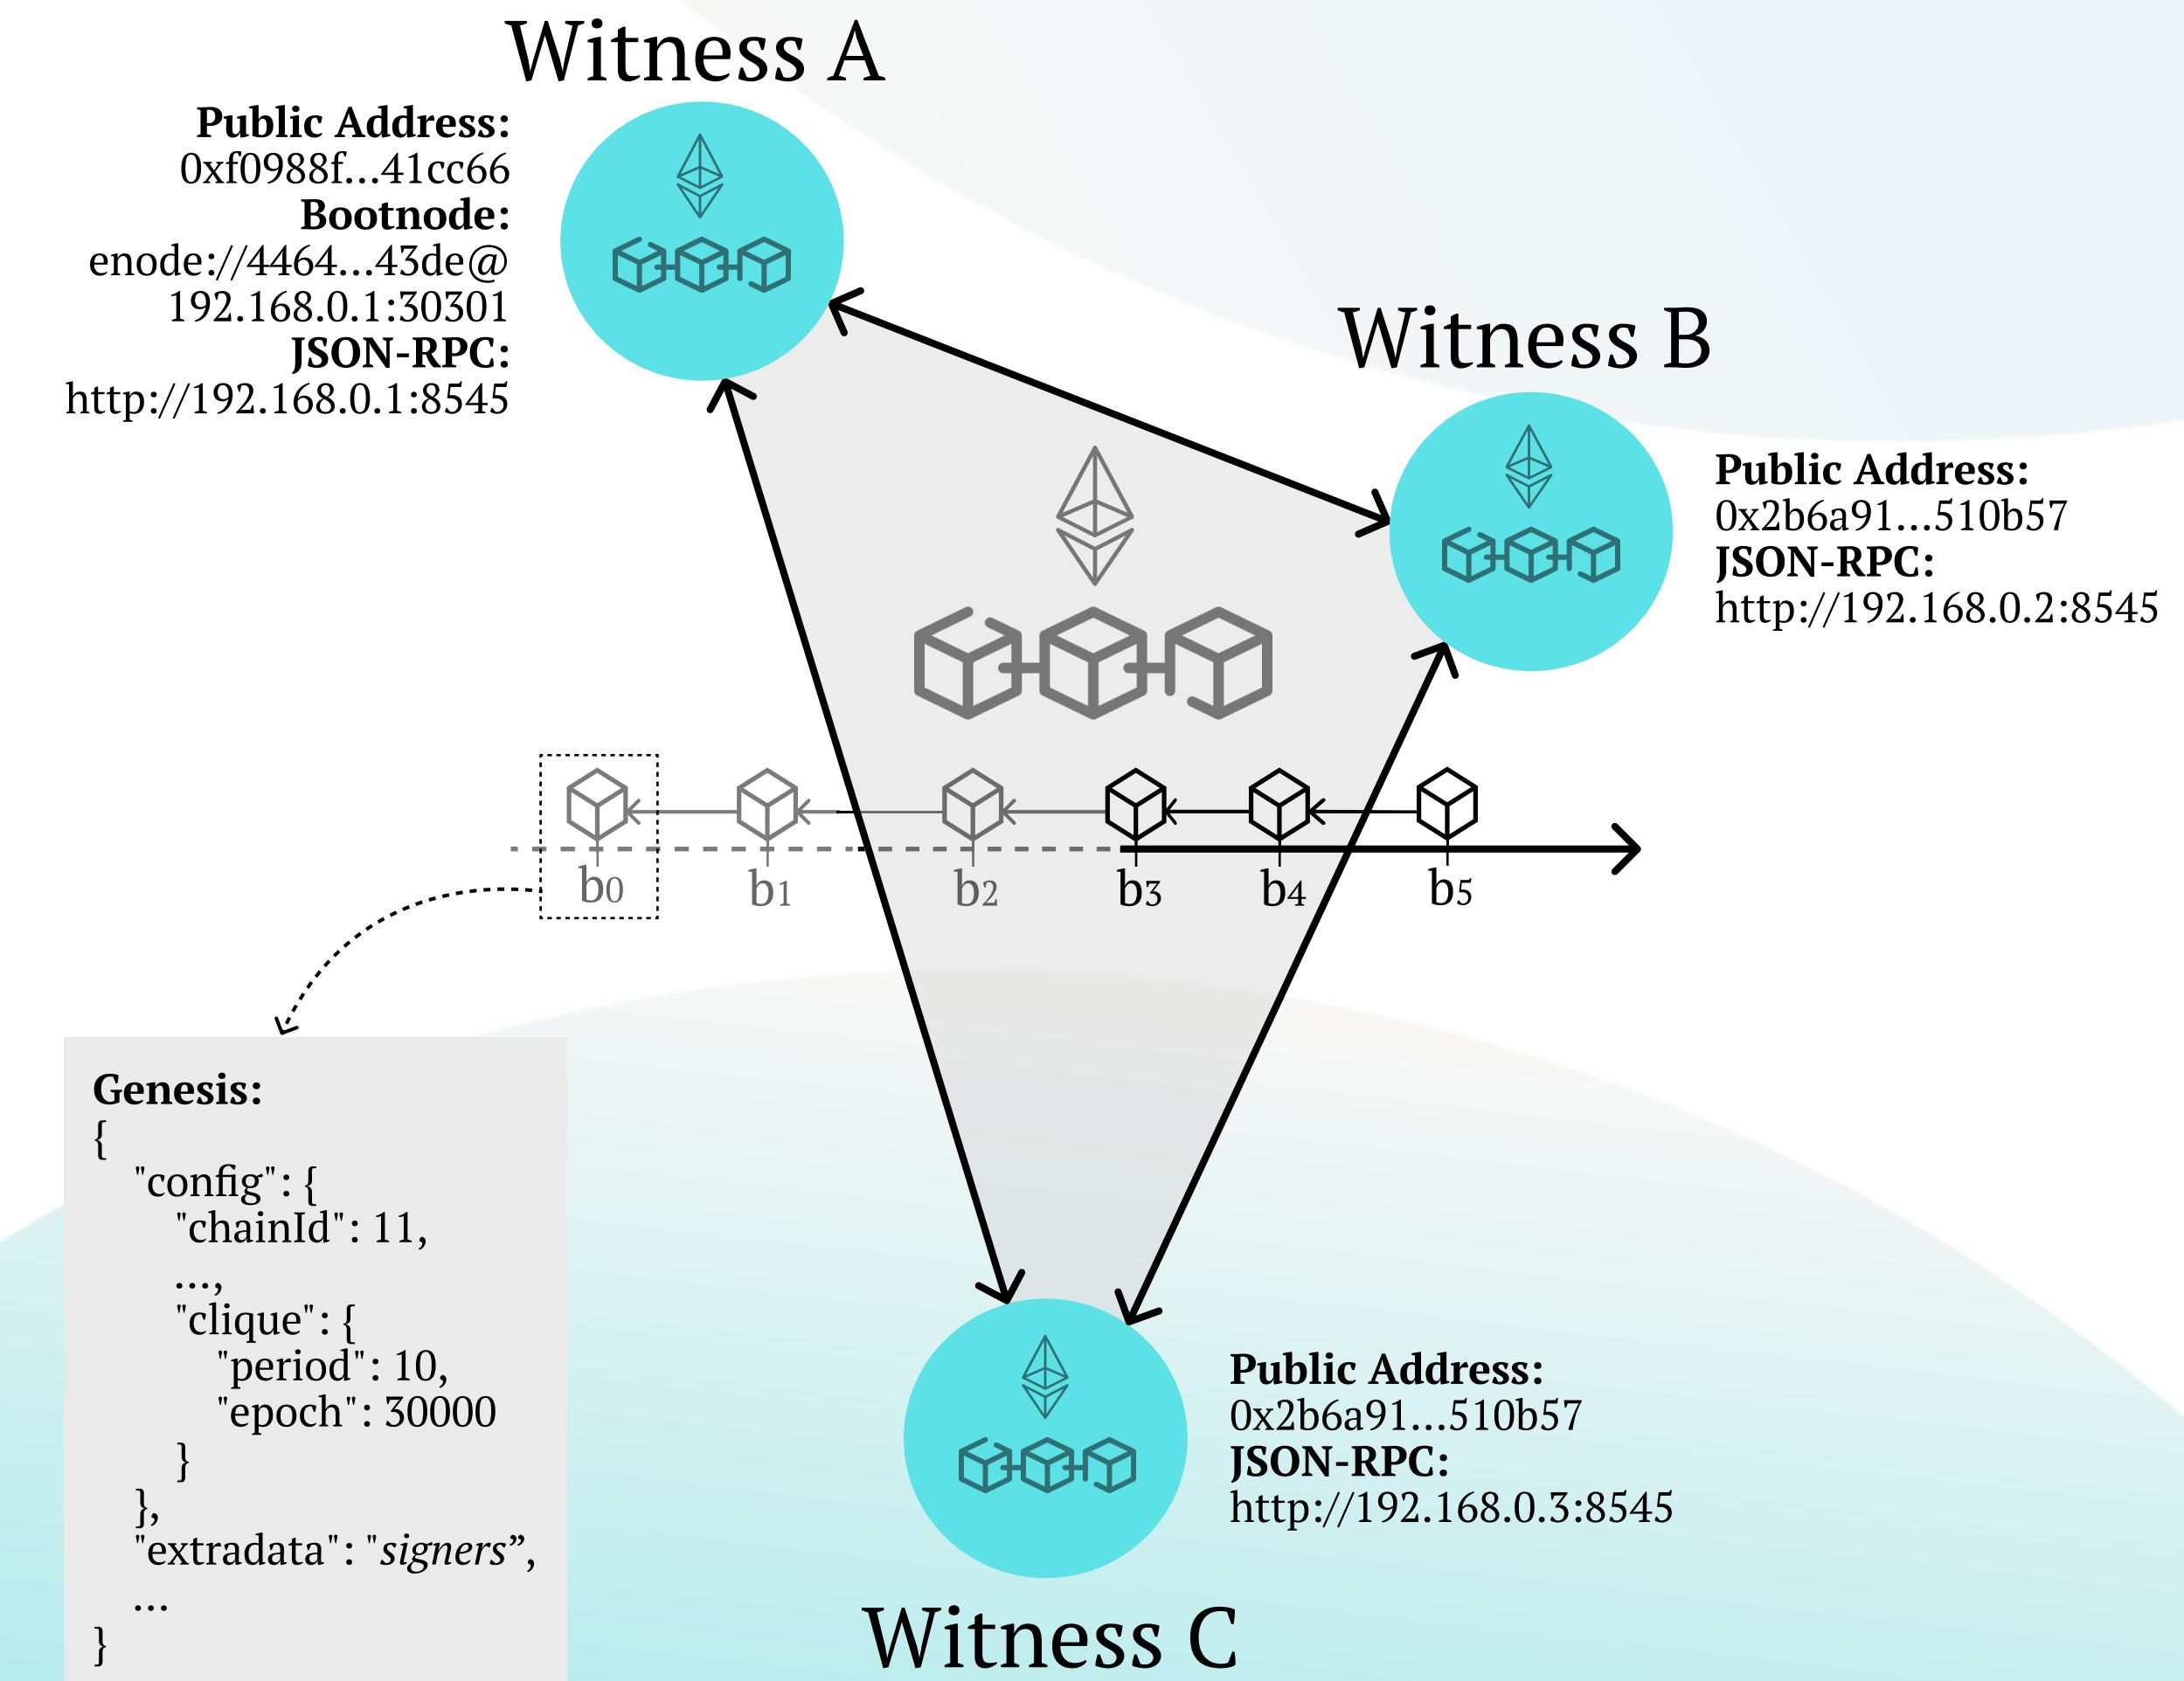

Permissionless Consensus Mechanisms

Practical Permissionless Consensus

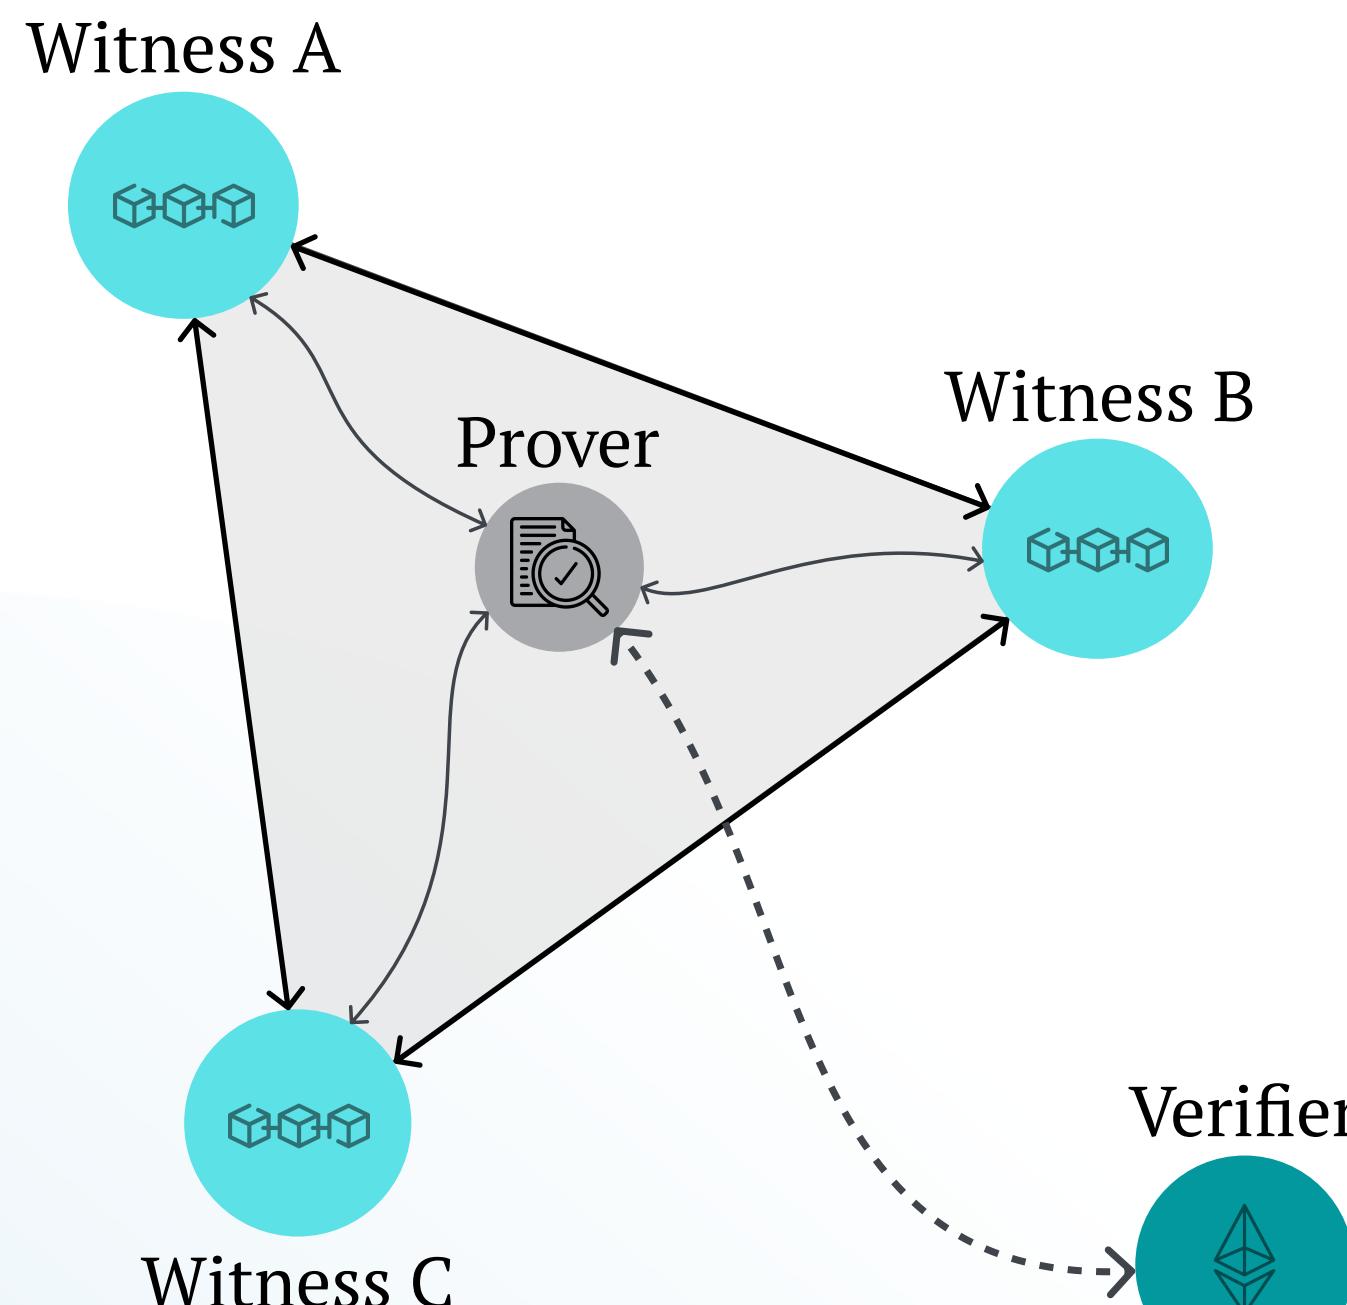

Ad-hoc Ethereum Network

1. Consensus protocol:
 - Proof-of-Work vs Proof-of-Authority
2. The block time:
 - fixed vs dynamic
3. Initialization and discovery:
 - Genesis file and bootnodes
4. Smart contracts:
 - Solidity and EVM

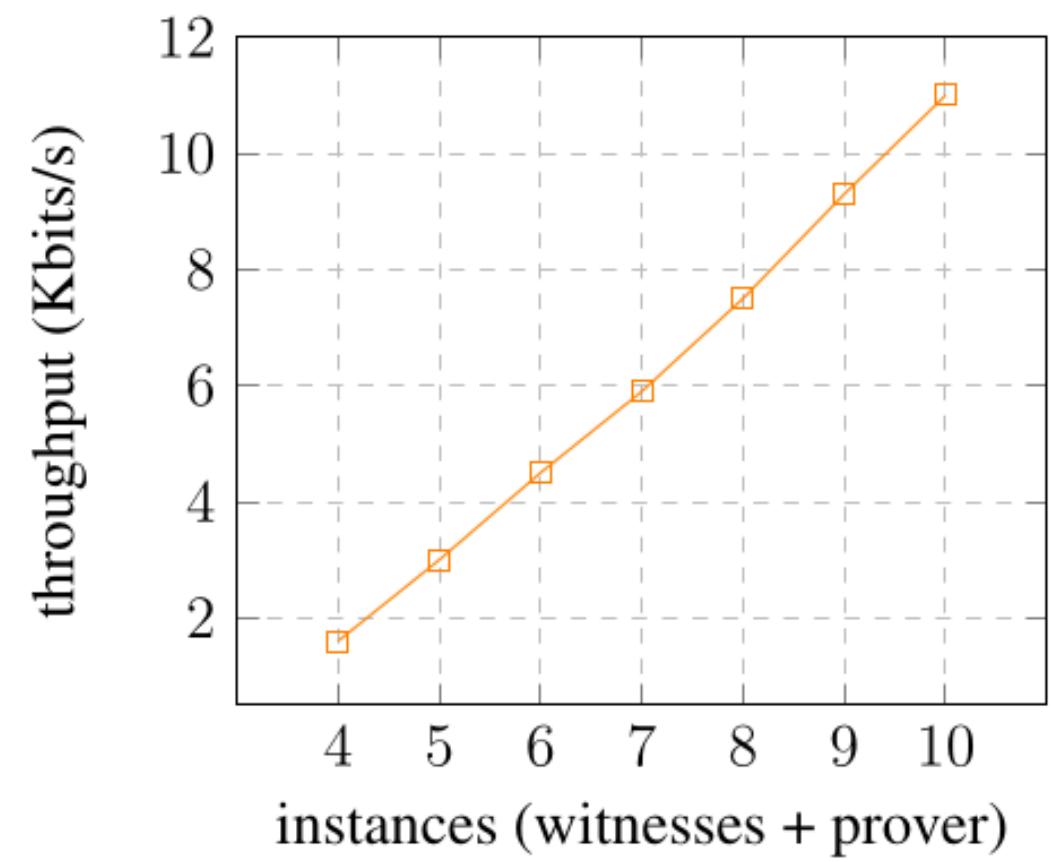

Proof Generation and Verification

Prover & Verifier Processes

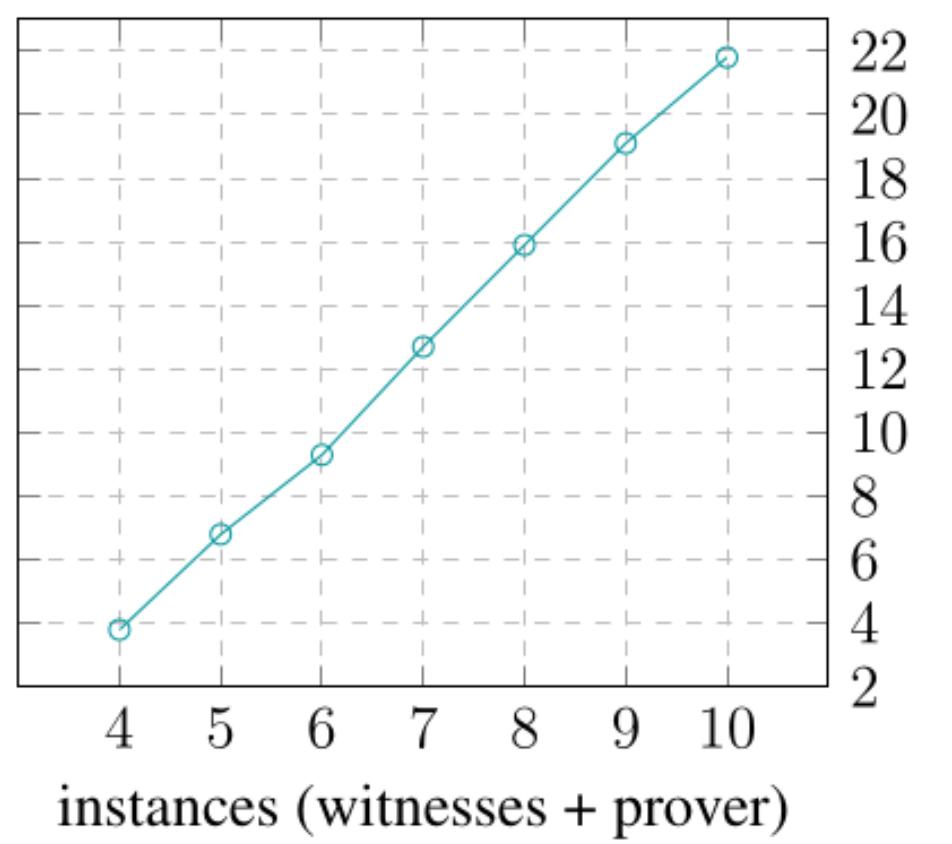

Performance Measurements

Protocols throughput

(a) Batman-adv traffic throughput.

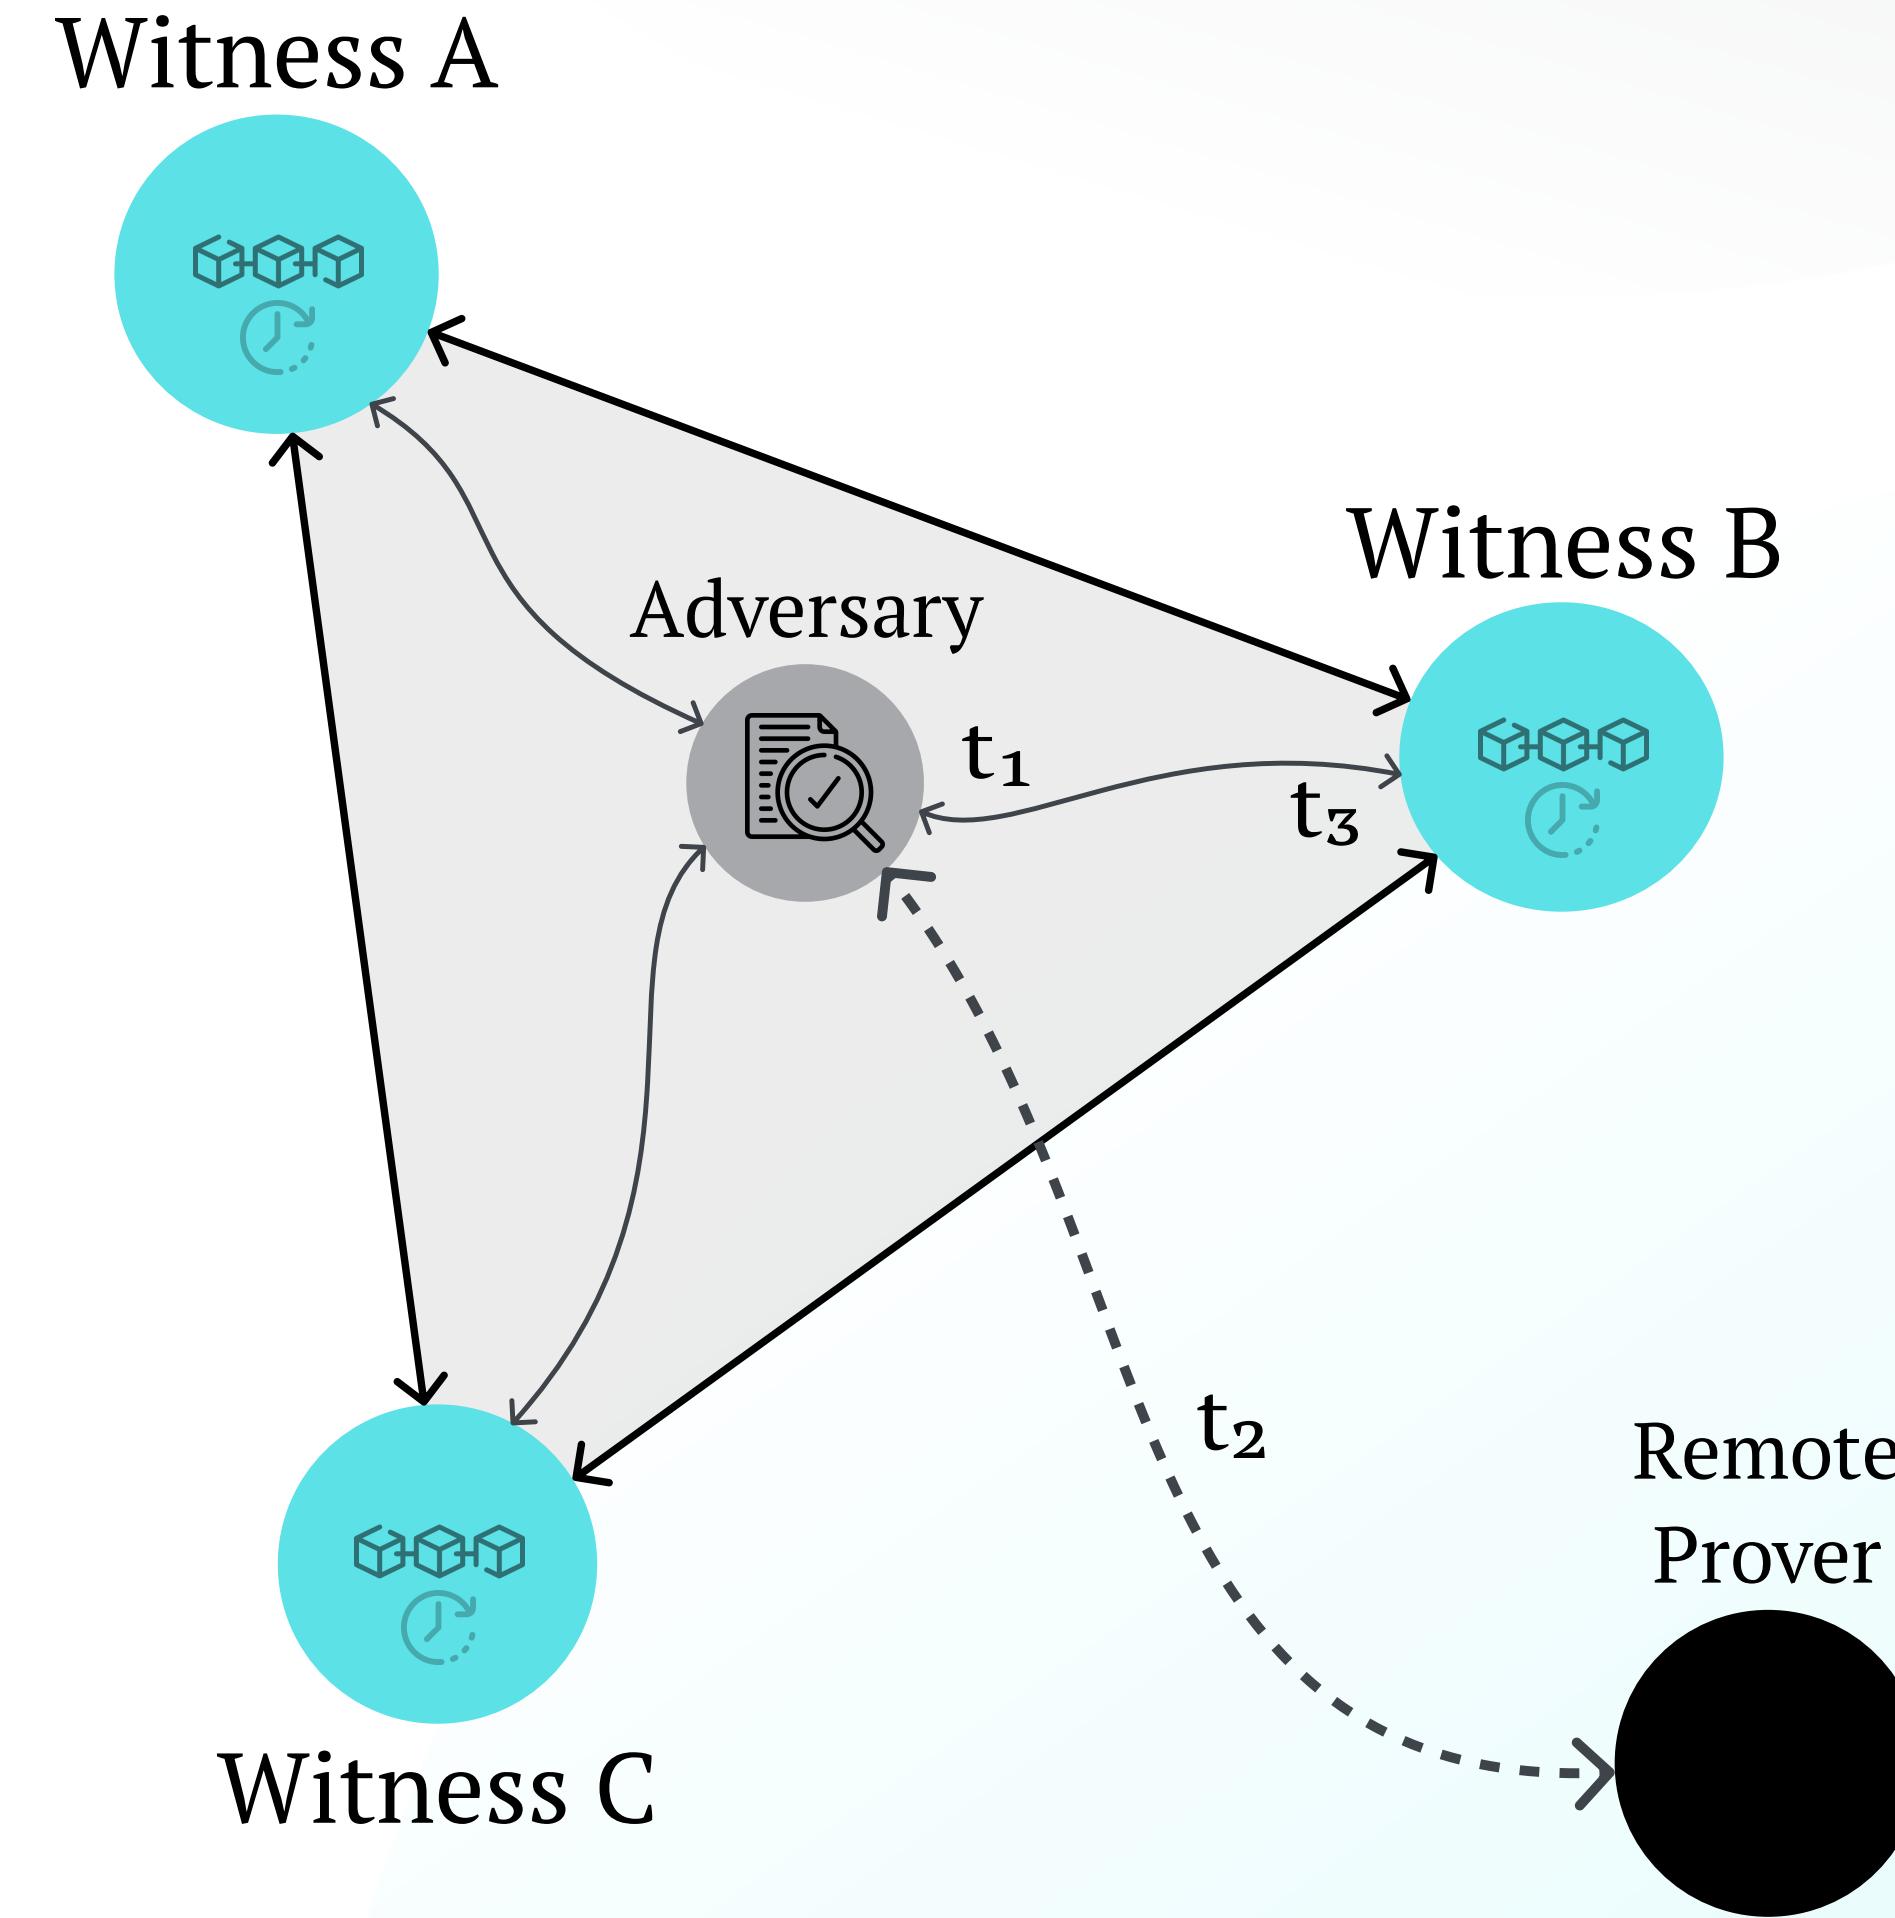

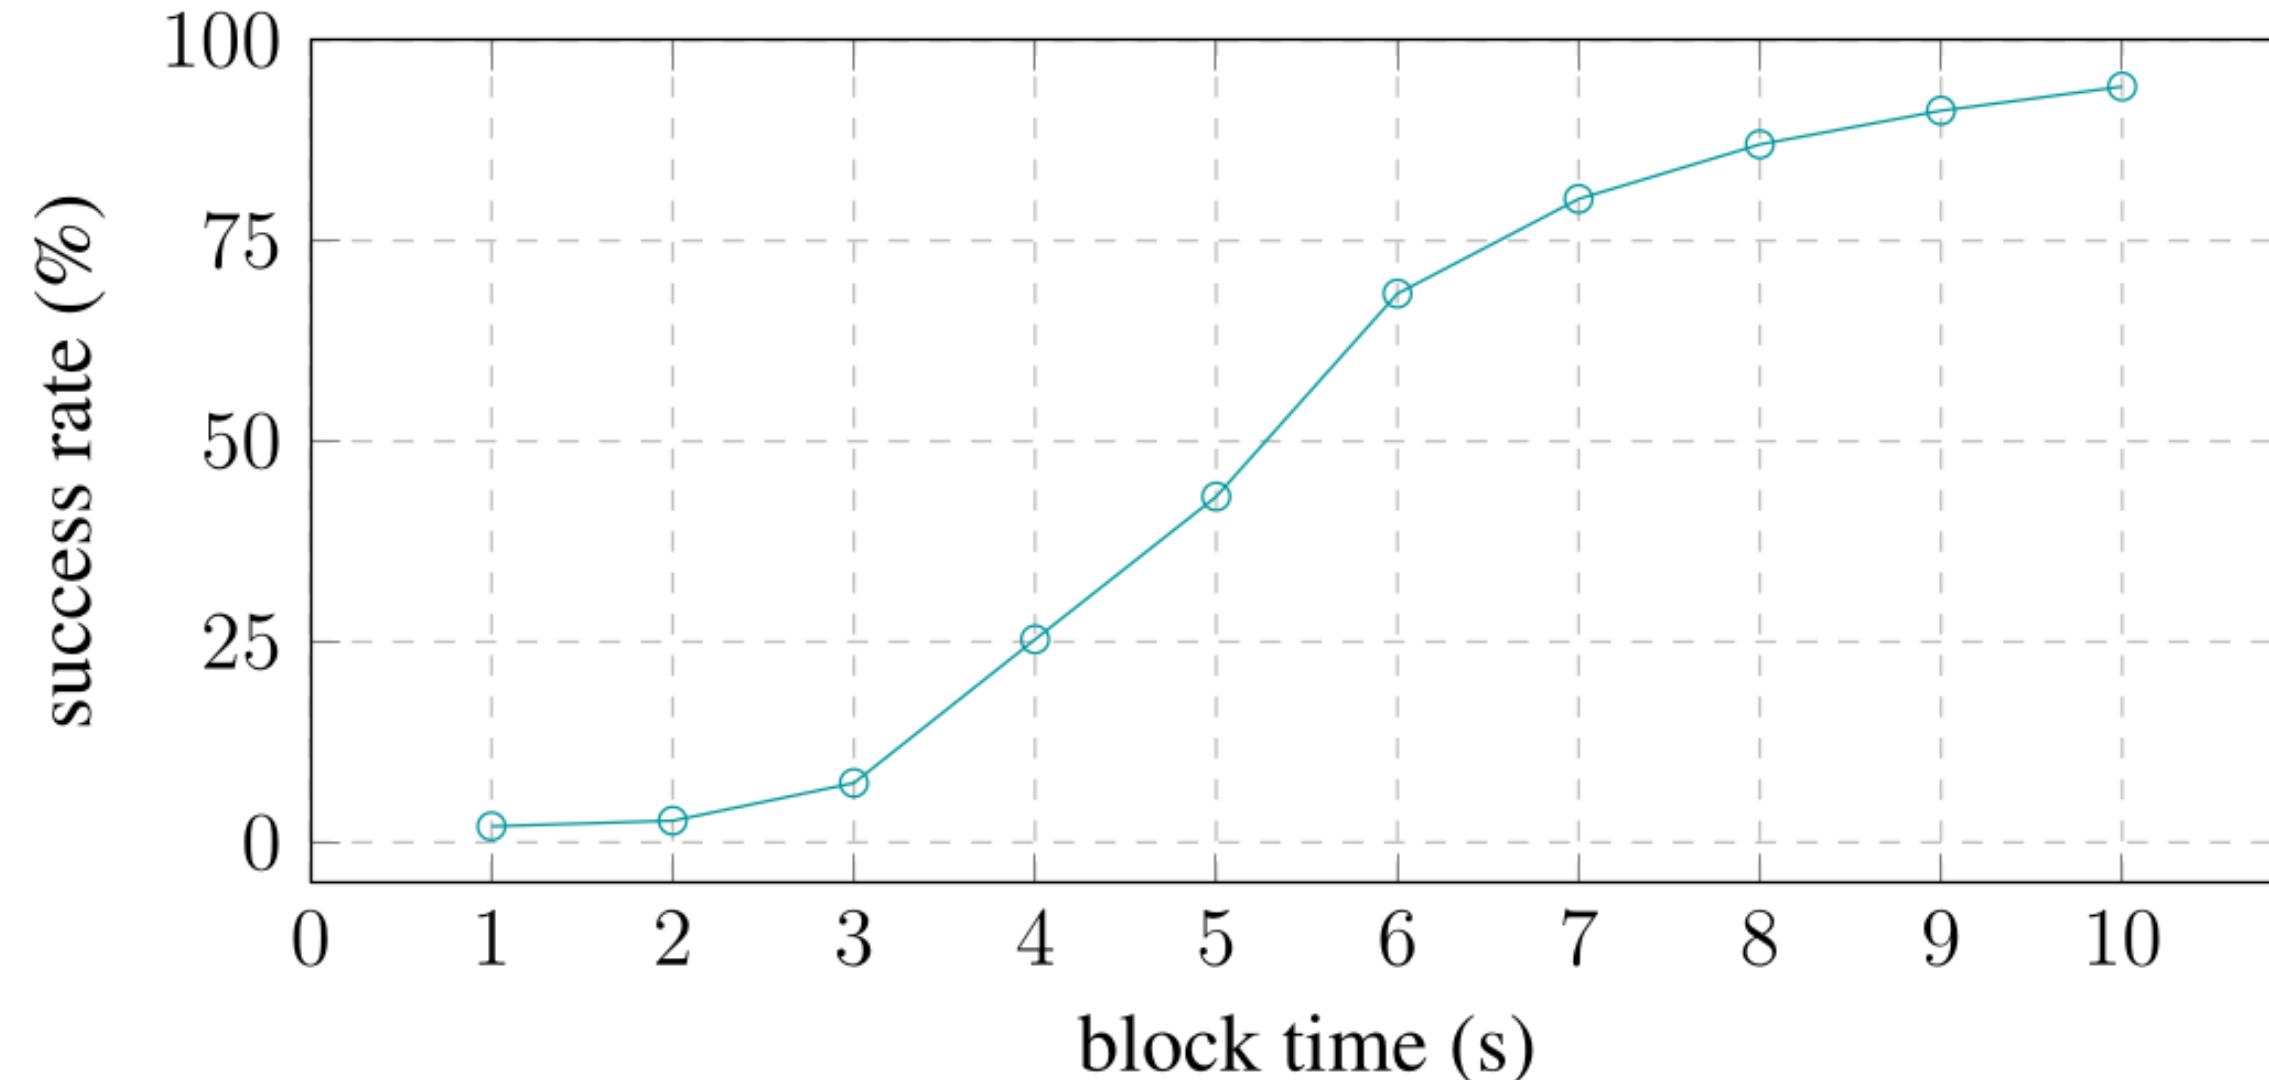

(b) IPv4 traffic throughput.

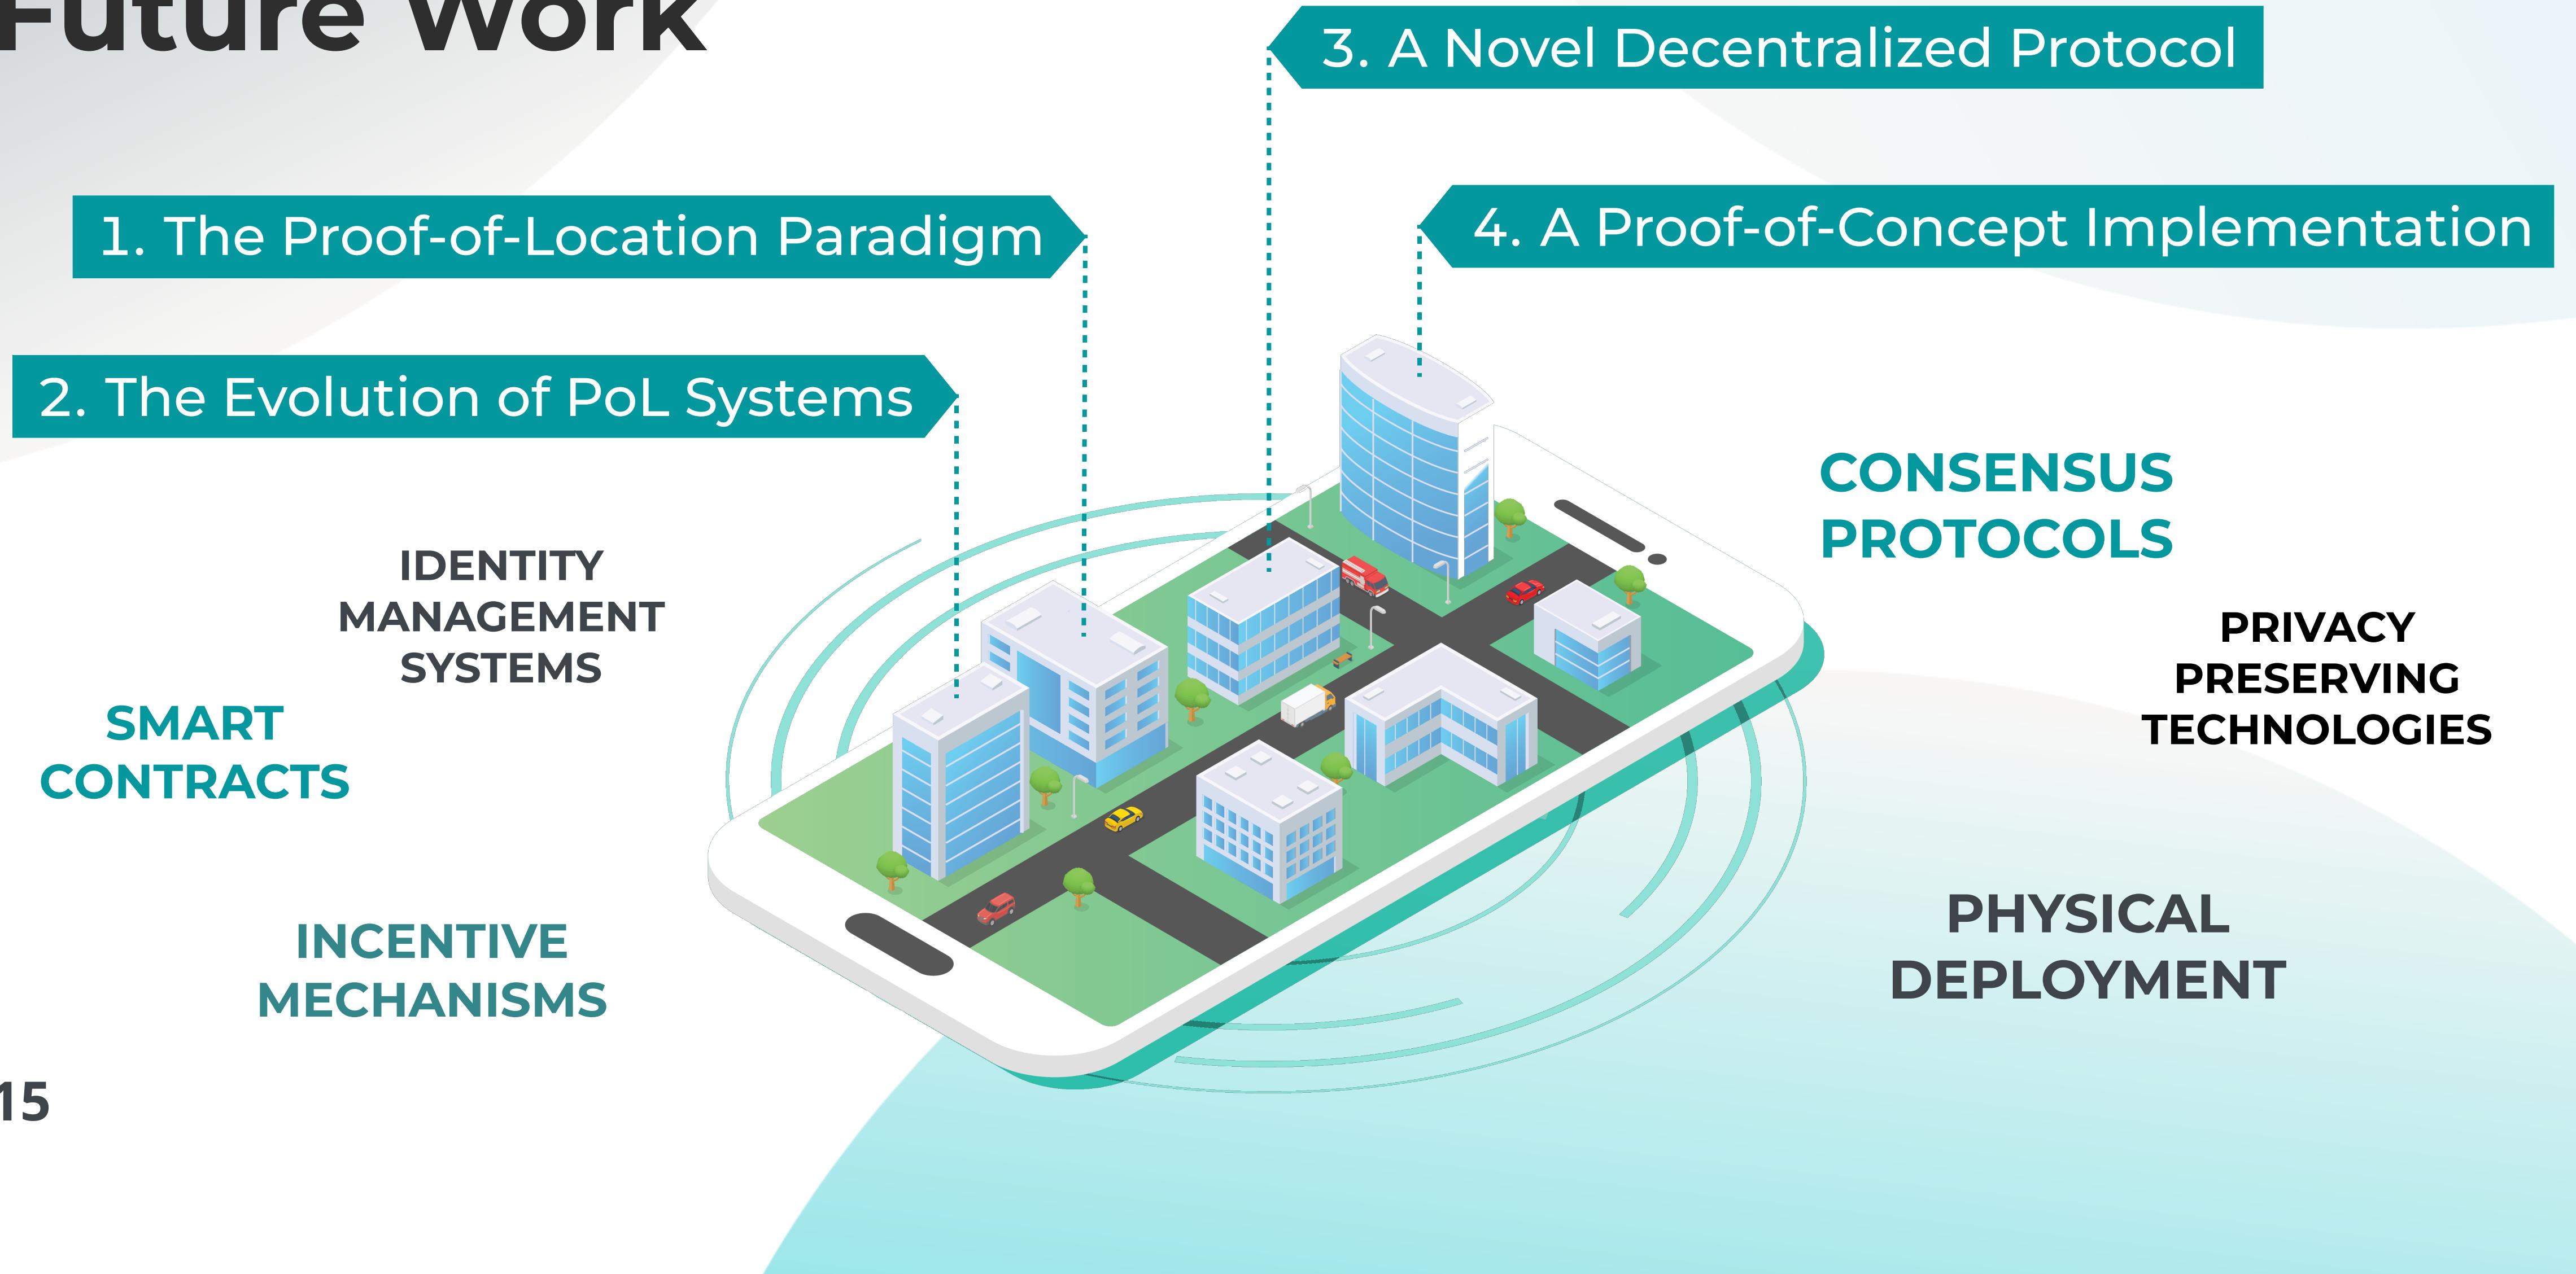

Success Rate and Attack Vectors

Block time and Proxy attacks

Summary and Future Work

Towards Decentralized Proof-of-Location

*Reality is merely an illusion,
albeit a very persistent consensual one.*

- **Albert Einstein**

Somewhere, at some point in time

Appendix

Overview

Protocol Fundamentals

From a dynamic mesh topology, towards the ultimate goal of achieving Absolute Proof-of-Location.

A. Mesh Network

B. Zone Discovery

C. Zone Affinity

D. Zone Synchronization

E. Relative Proof-of-Location

F. Absolute Proof-of-Location

↔ short-range, synchronous communication

↔ long-range, asynchronous communication

Smart Contracts

Turing-Completeness use cases

Absolute Proof-of-Location

From Relative Proof-of-Location

A Proof-of-Location certificate to be spatially and temporally acknowledged by any other node outside the zone needs:

- Global Time Synchronization Protocol
 - NTP, PTP, Public Blockchain?
 - Trusted timestamping?
- Global Positioning System
 - GPS, crypto-spatial coordinates?

Measurements

Blockchain Activity & Success Rate

1. The interval time between blocks matches the higher peaks of TCP traffic, while the UDP traffic is more evenly distributed.
2. A more permissive block time allows for a lower number of invalid certificates, but also for a higher probability of witnessing malicious activity.

19

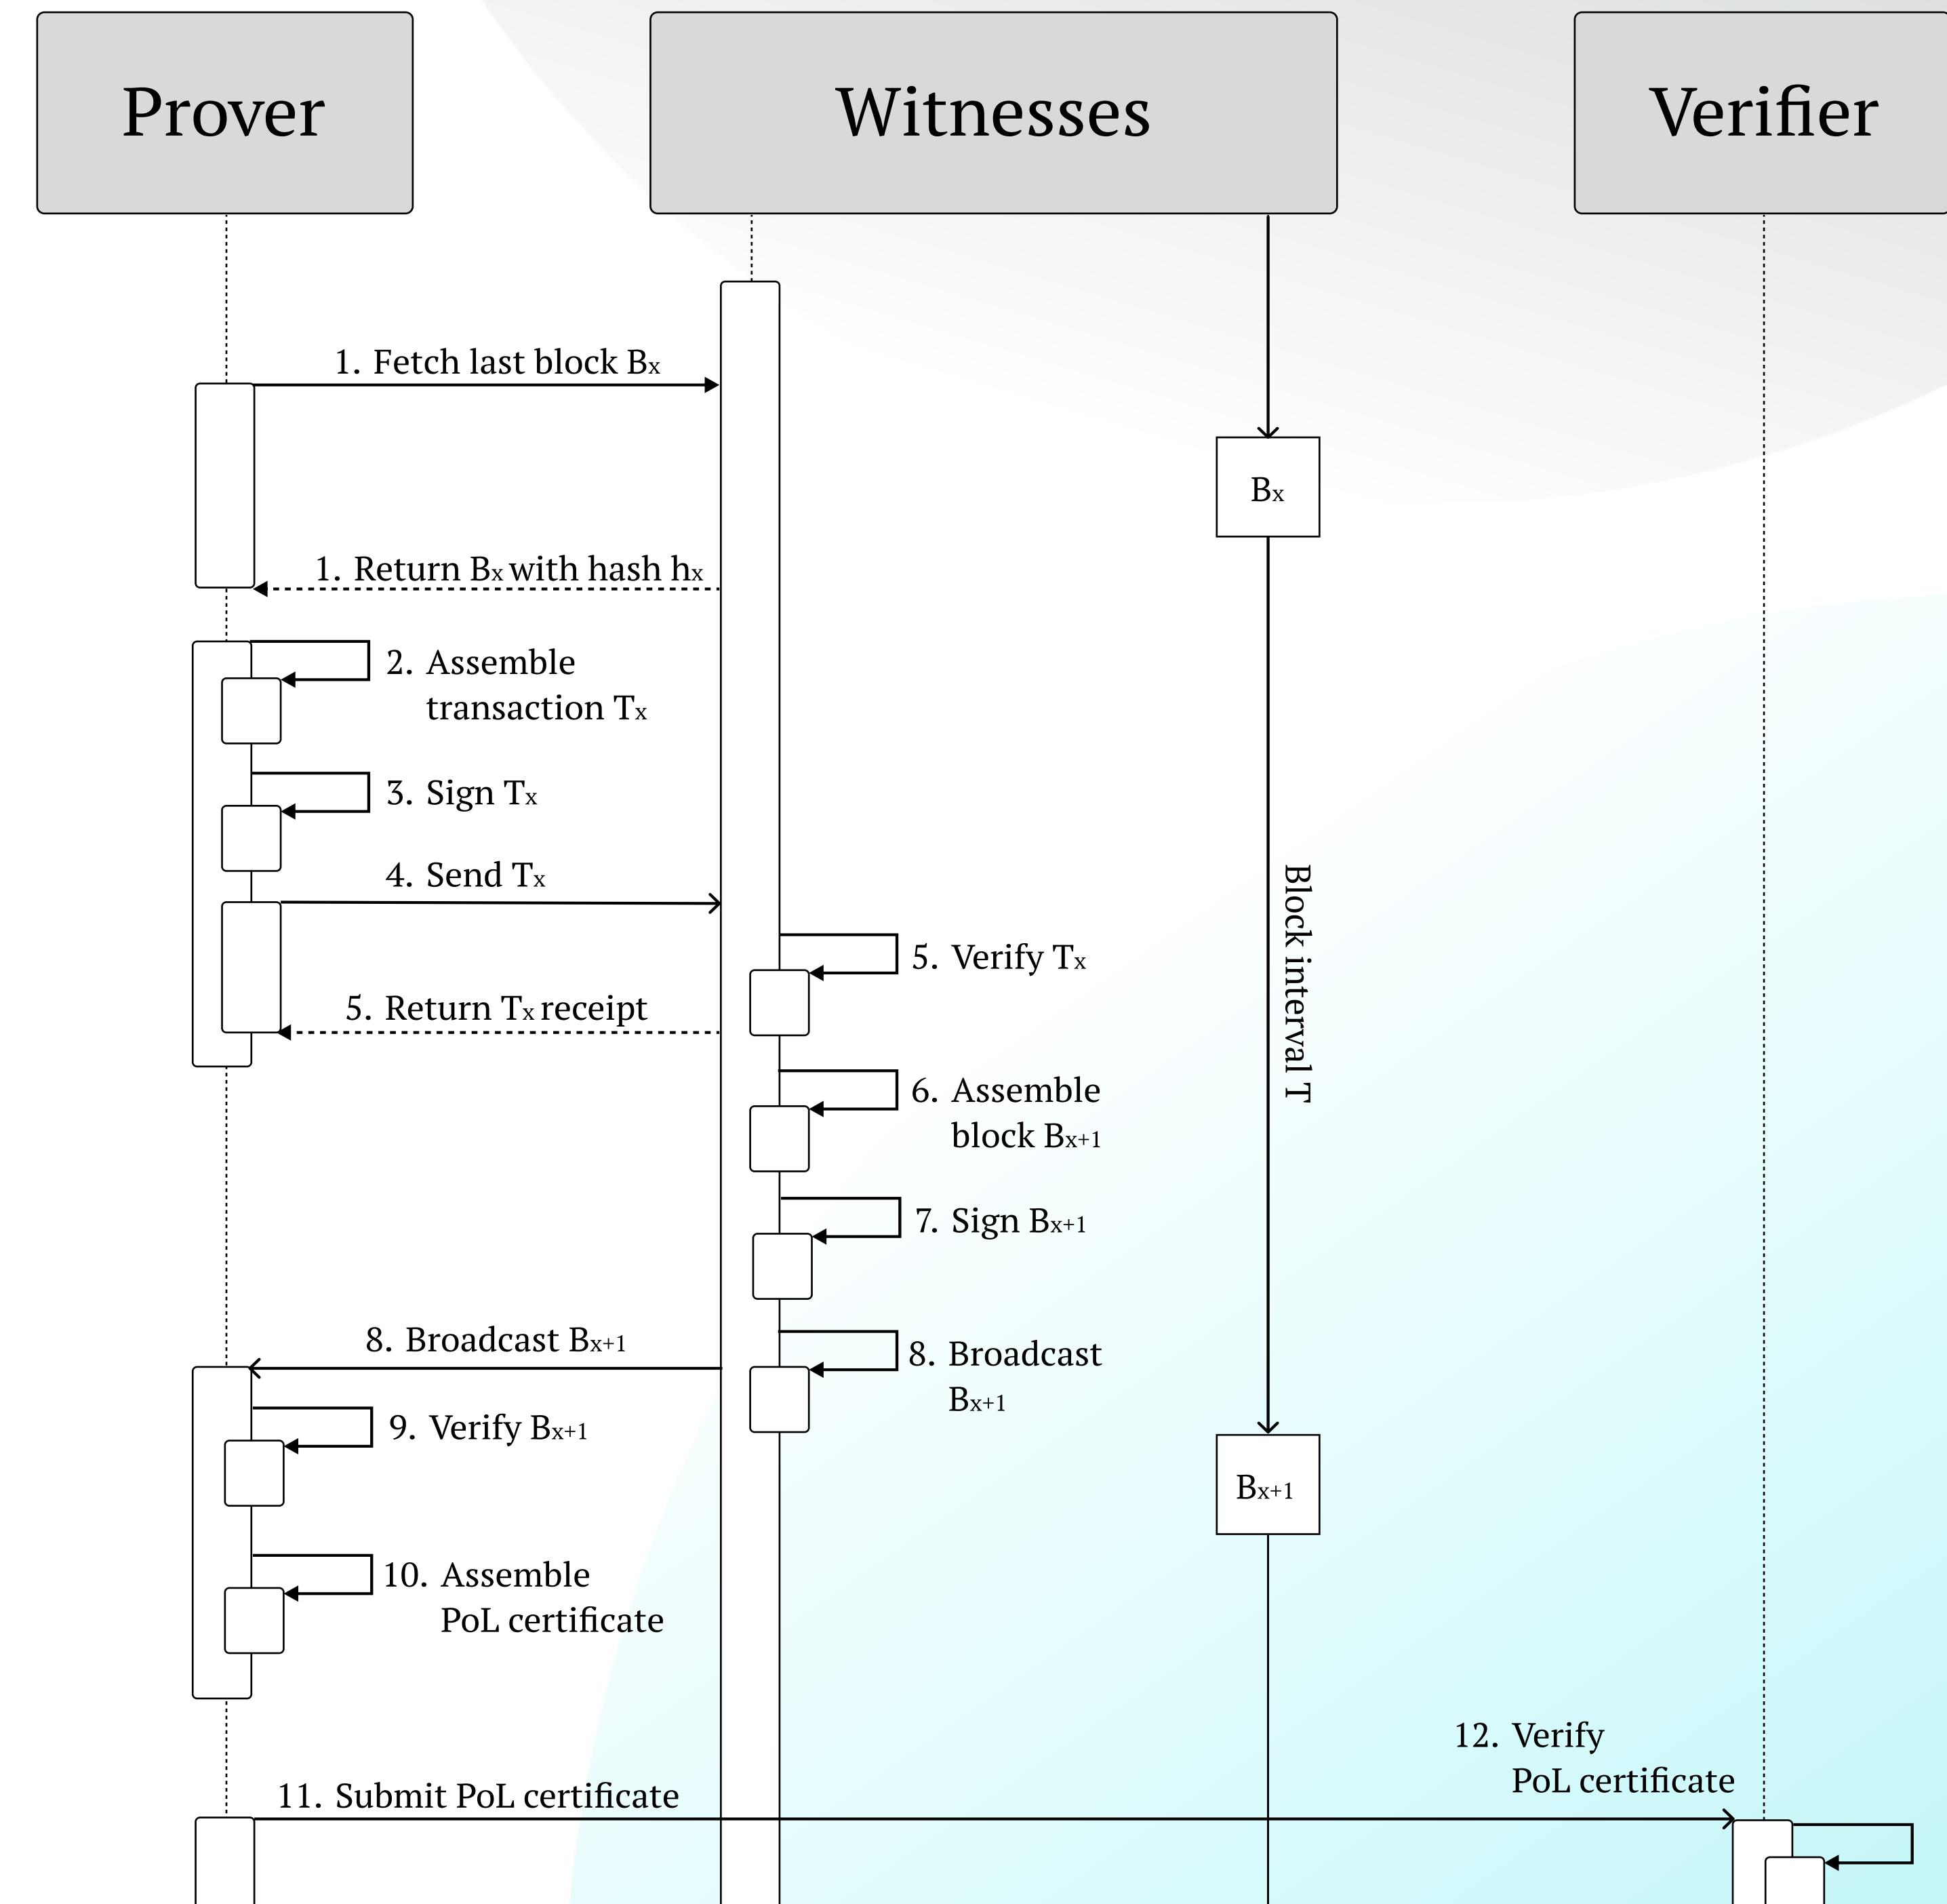

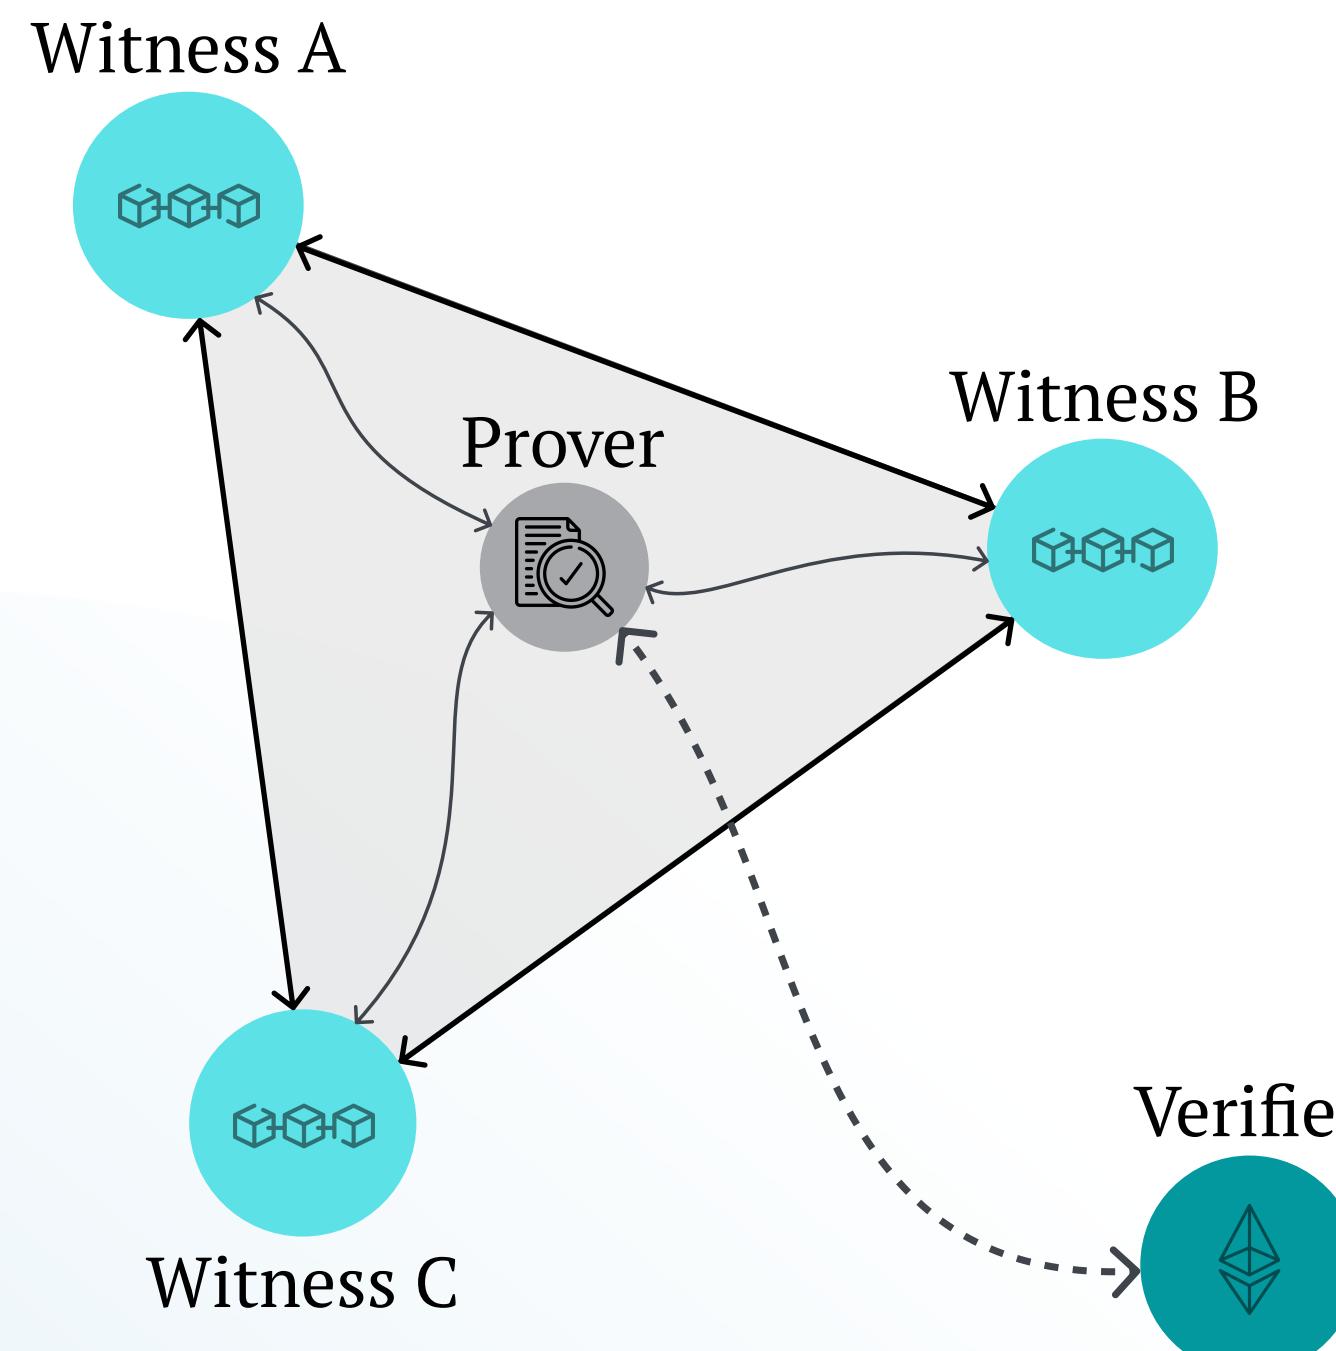

(a) 4 instances.

(b) 8 instances.

Proof Generation and Verification

Future Work

1. Zone Establishment and Affinity:

- a. More effective identity management systems and crypto-economic incentives

2. Consensus Mechanisms:

- a. From deterministic-finality Byzantine fault-tolerant algorithms to probabilistic finality consensus mechanisms

3. Smart Contracts:

- a. Making full use of the system's Turing completeness for more complex logic

4. Protocol Extensibility:

- a. Integration of privacy preserving mechanisms, such as zero-knowledge proofs

5. Physical Deployment:

- a. And the evaluation of the performance in real-world scenarios
